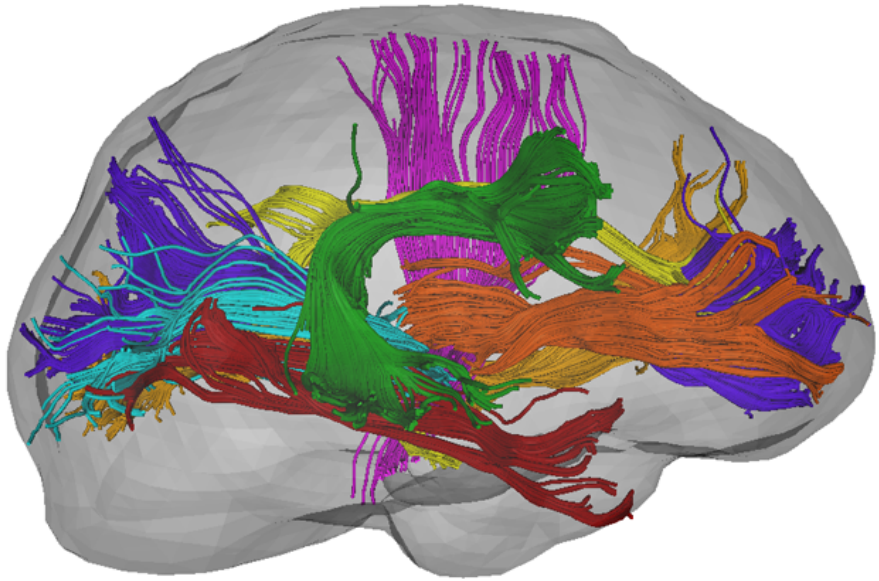
What is Tractography?

Post-mortem dissection of some white matter fibre bundles (tracts)

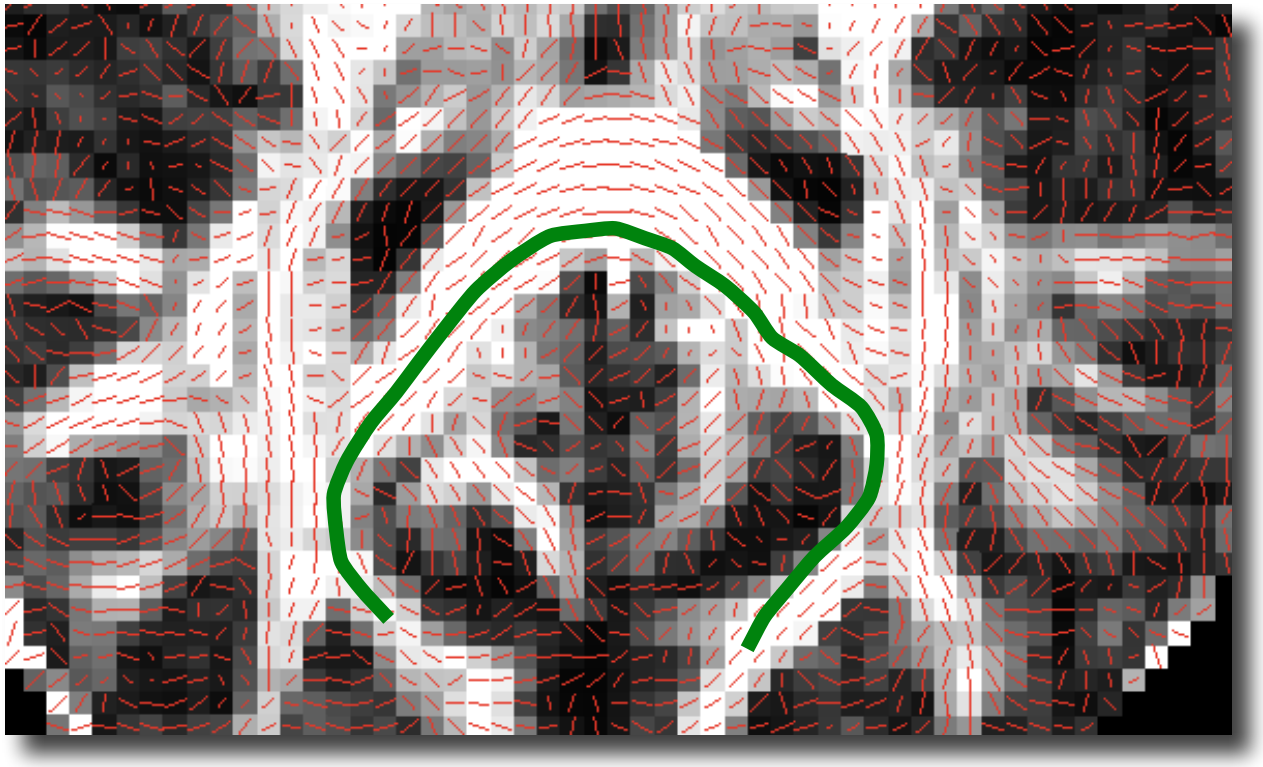
Williams, Gluhbegovic, and Jew, "The Human Brain`; Dissections of the Real brain", Virtual Hopstital, Universitoy of Iowa, 1997

Tractography
The post-imaging reconstruction of fibre bundles/ anatomical connections in the brain using a set of DW images. (in-vivo virtual dissection)

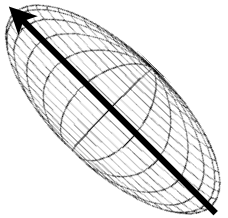


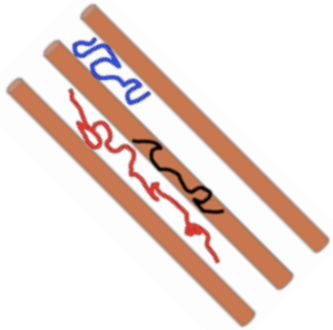
DTI tractography

$\mathbf{v}_1$ map
Principal Diffusion Direction



Principal Diffusion Direction

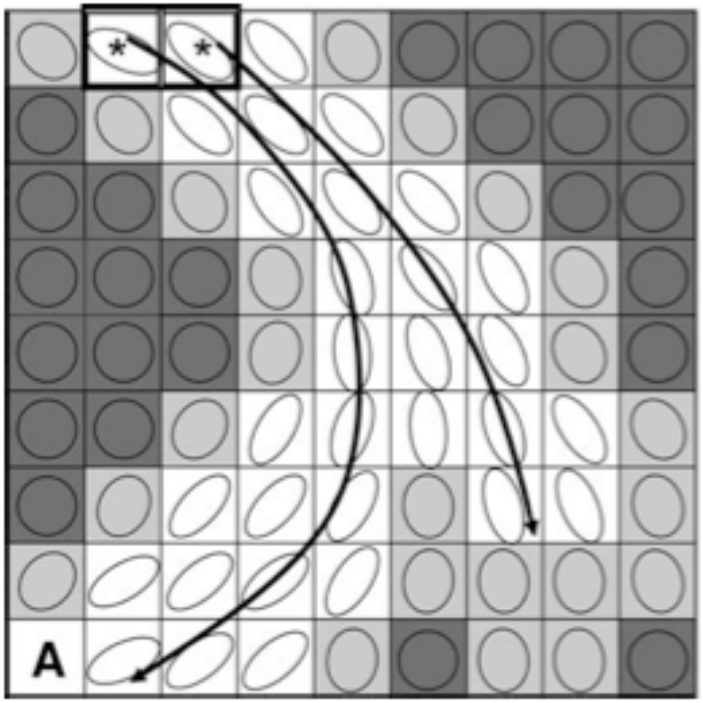




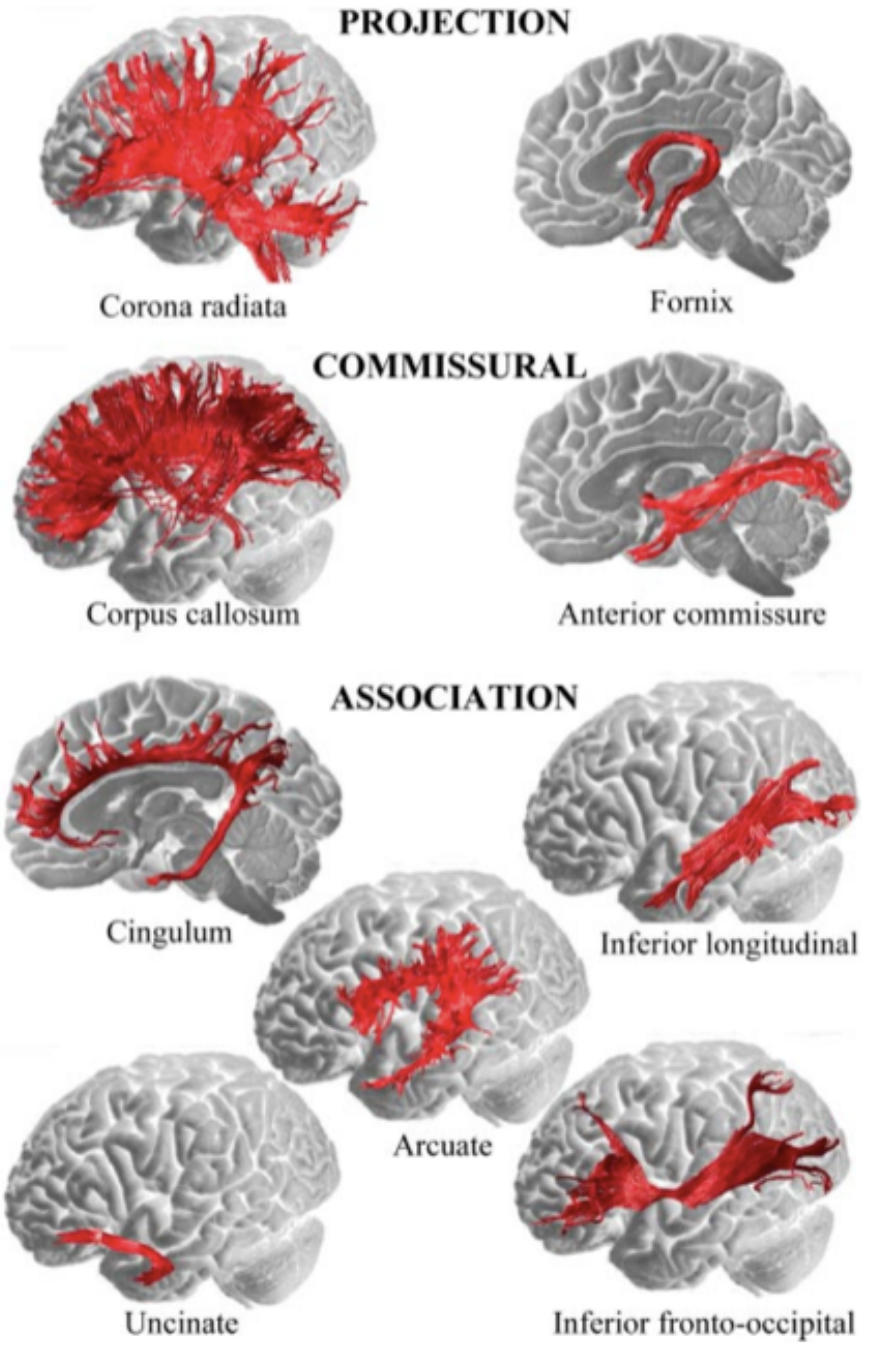
<u>Assumption</u>:

Direction of maximum diffusivity
(in anisotropic voxels)
is an **<u>estimate</u> of the major fibre orientation**.

DTI tractography



[Basser et al, Magn Reson Med, 2000]

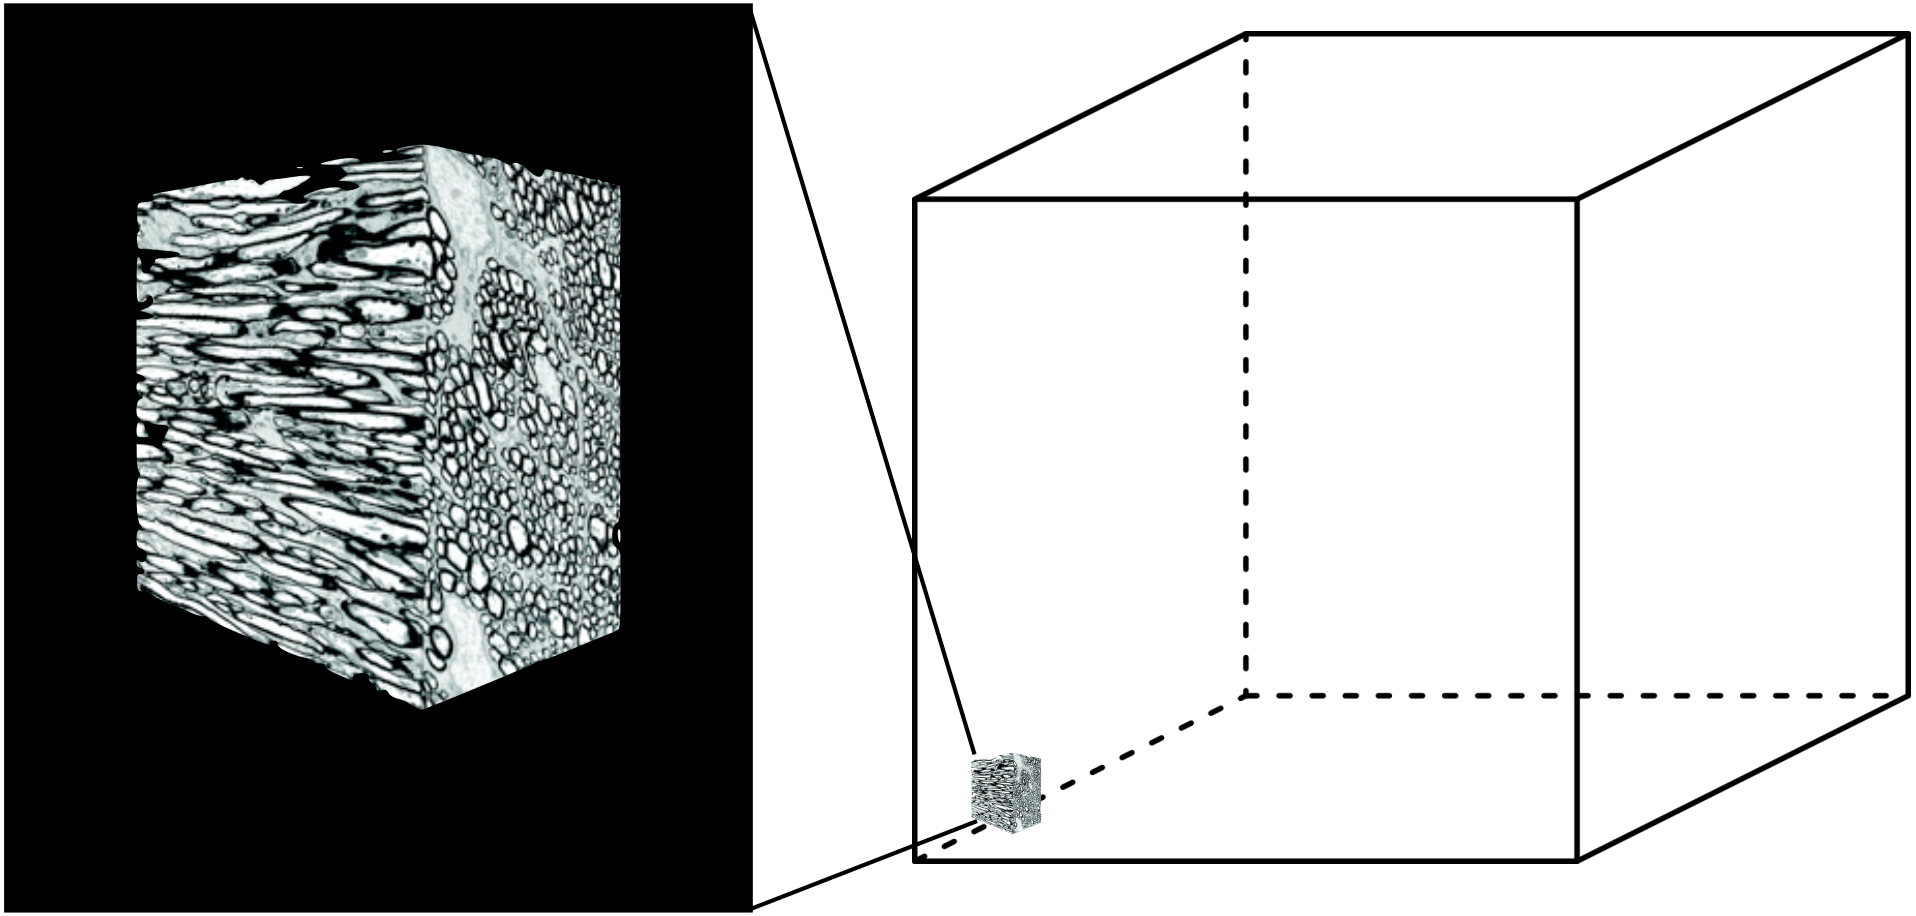


[Catani et al, NeuroImage, 2003]

Problems of scale

Microscopic view of white matter axon size (~µm)

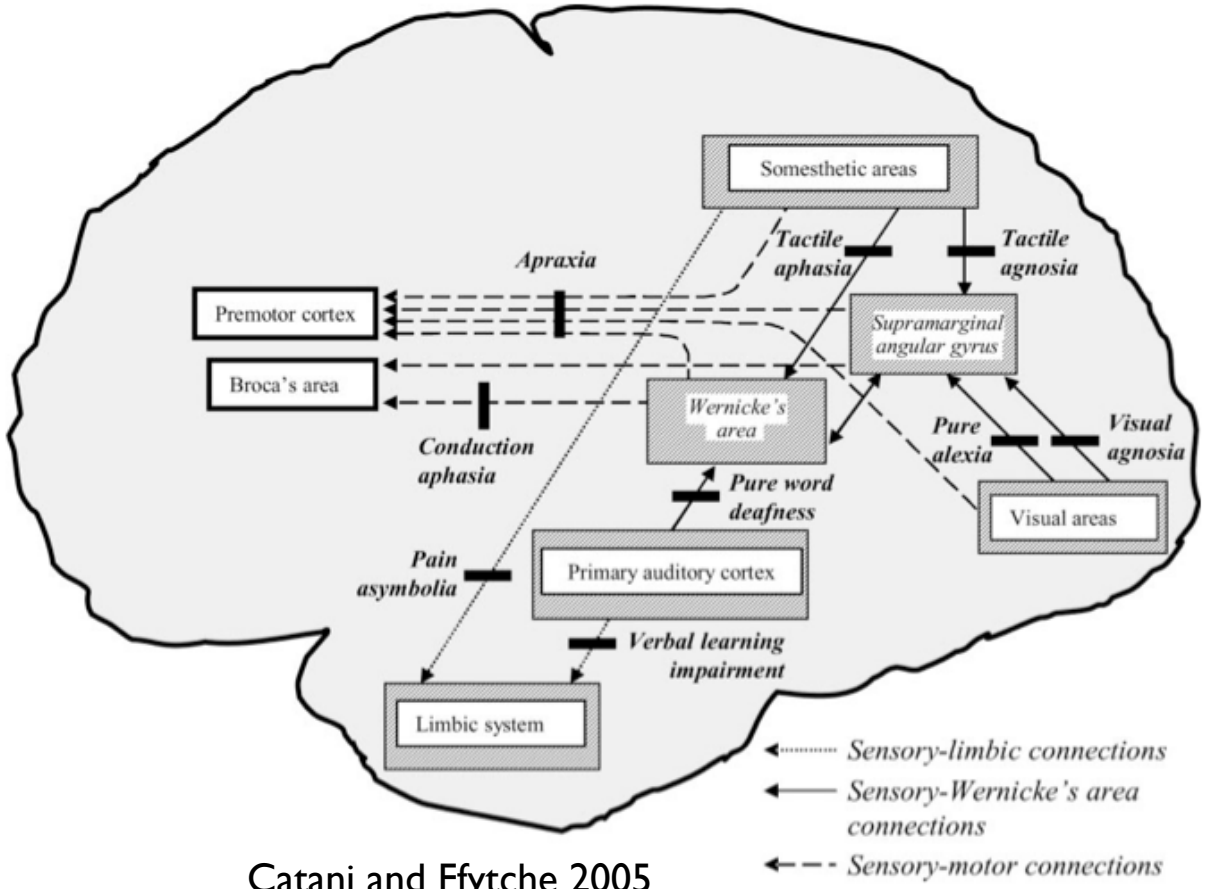
MRI voxel size (~mm)



Ohno et al. 2013

Connectivity - Why do we care?

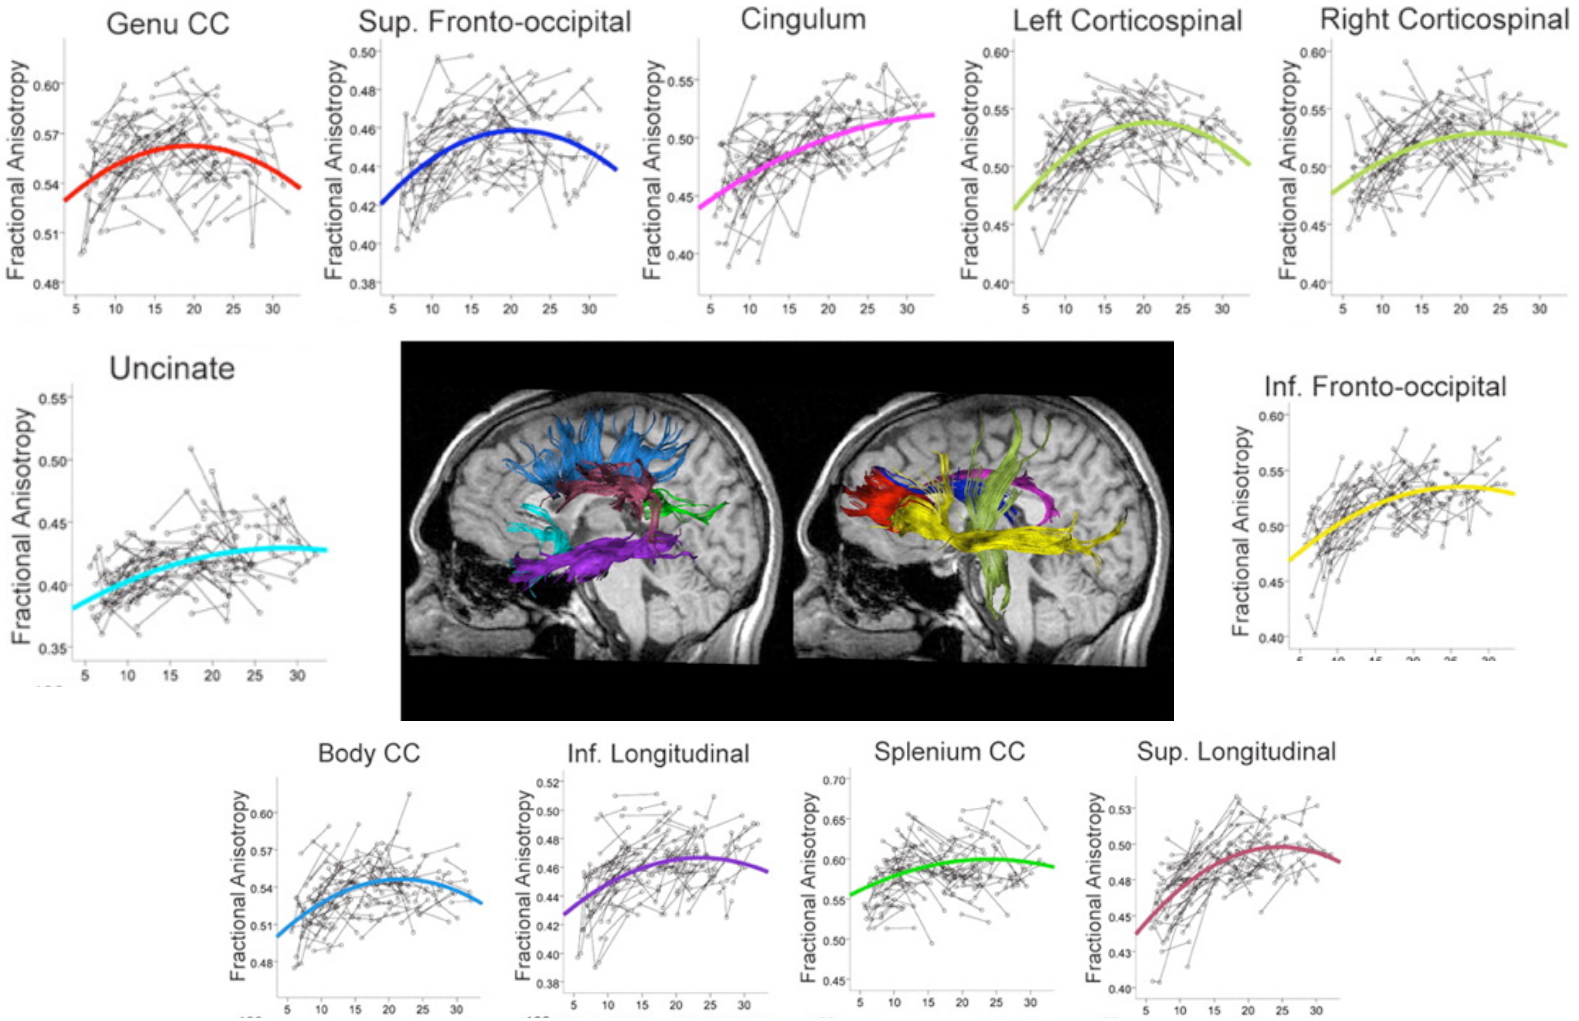
- White matter (dys)connectivity is thought to form the substrate for many different neurological and psychiatric disorders.



Catani and Ffytche 2005

Connectivity - Why do we care?

- Tractography provides non-invasive localisation and semi-quantitative biomarkers

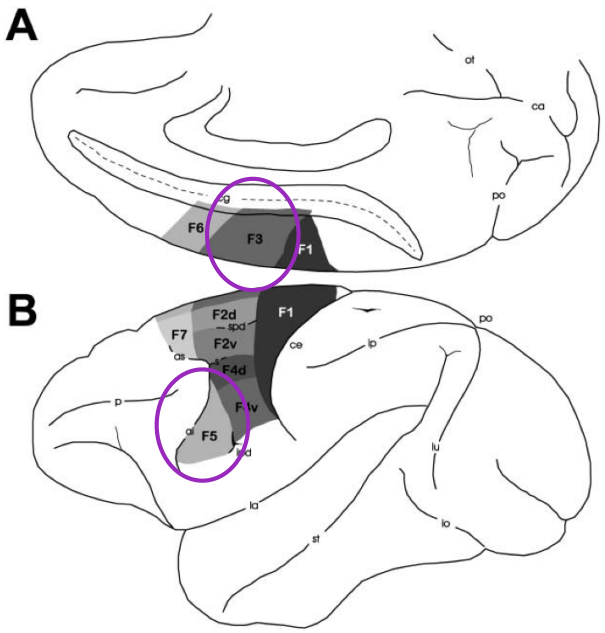


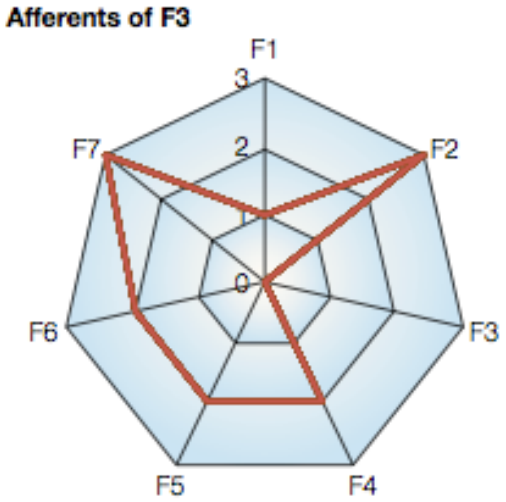
Lebel, Beaulieu J Neuroscience 2011

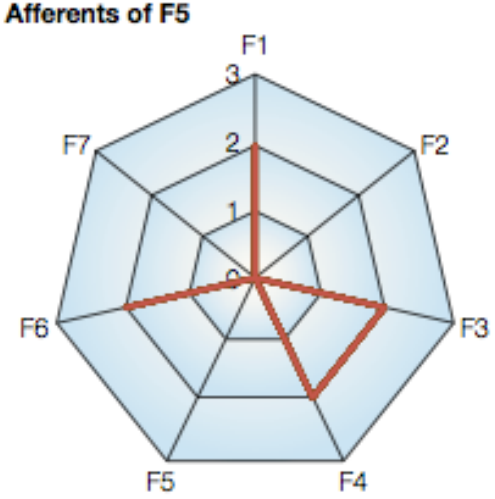
Connectivity - Why do we care?

- Connections constrain function

- Different regions have distinct connectivity fingerprints



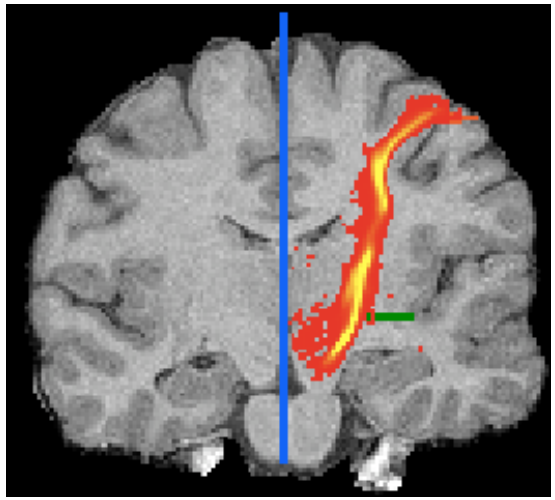


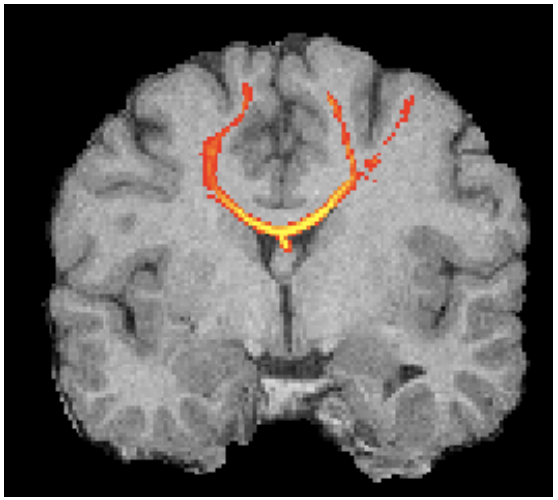


Passingham et al. 2002

Tractography outputs

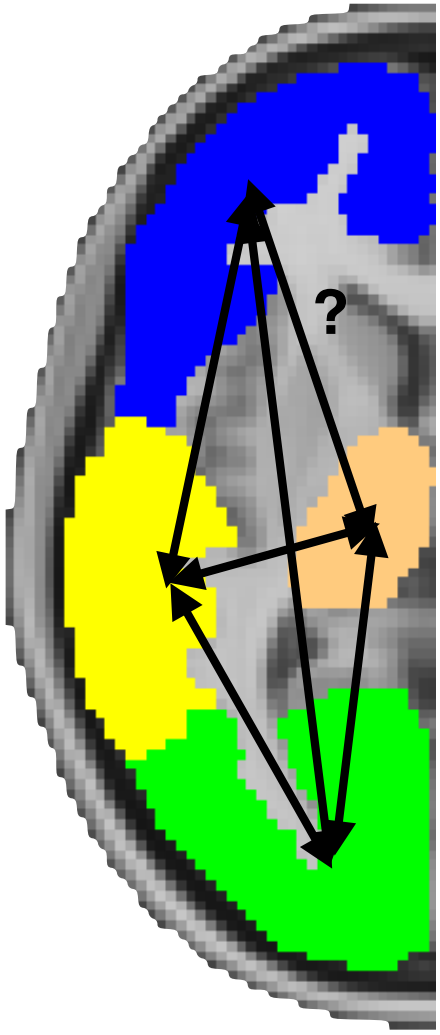
Known white matter tracts



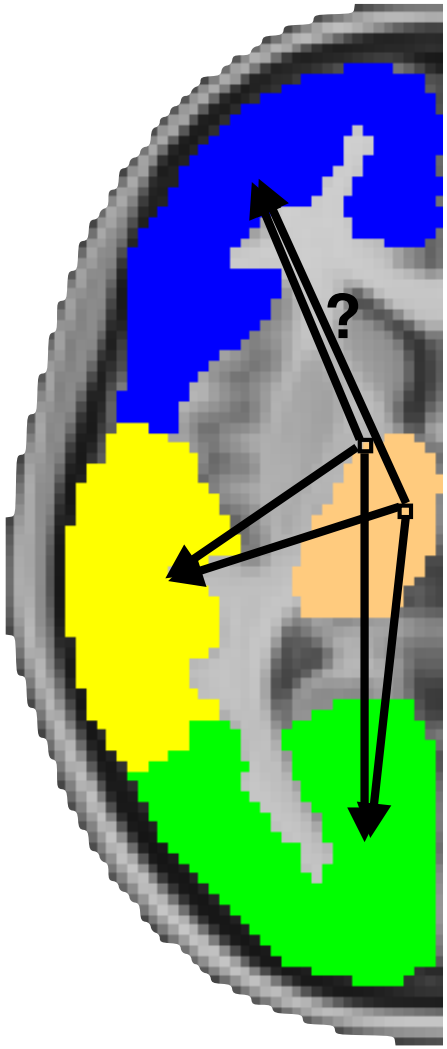


Connectivity matrices

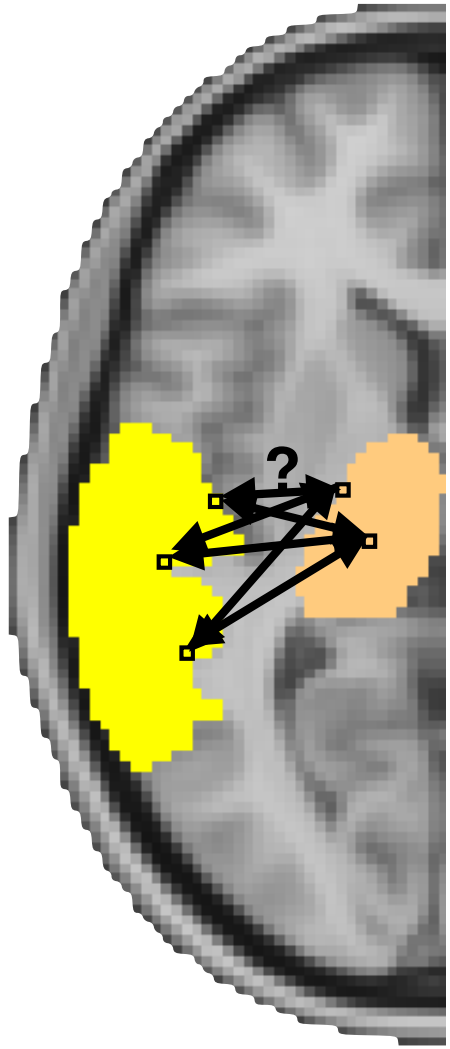
ROI by ROI



voxel by ROI

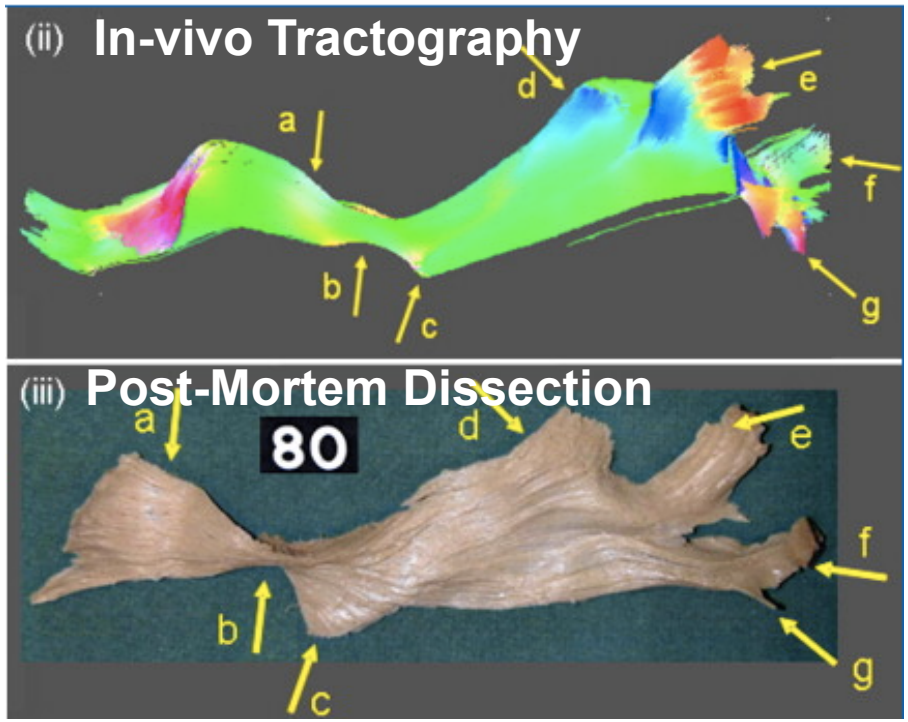


voxel by voxel



What does tractography offer?

+ non-invasive
+ in-vivo
+ whole brain
+ can address new questions



Lawes et al. 2008

...But
- low resolution (large bundles)
- indirect (diffusion paths)
- error prone (MRI is noisy)
- difficult to interpret quantitatively

Overview

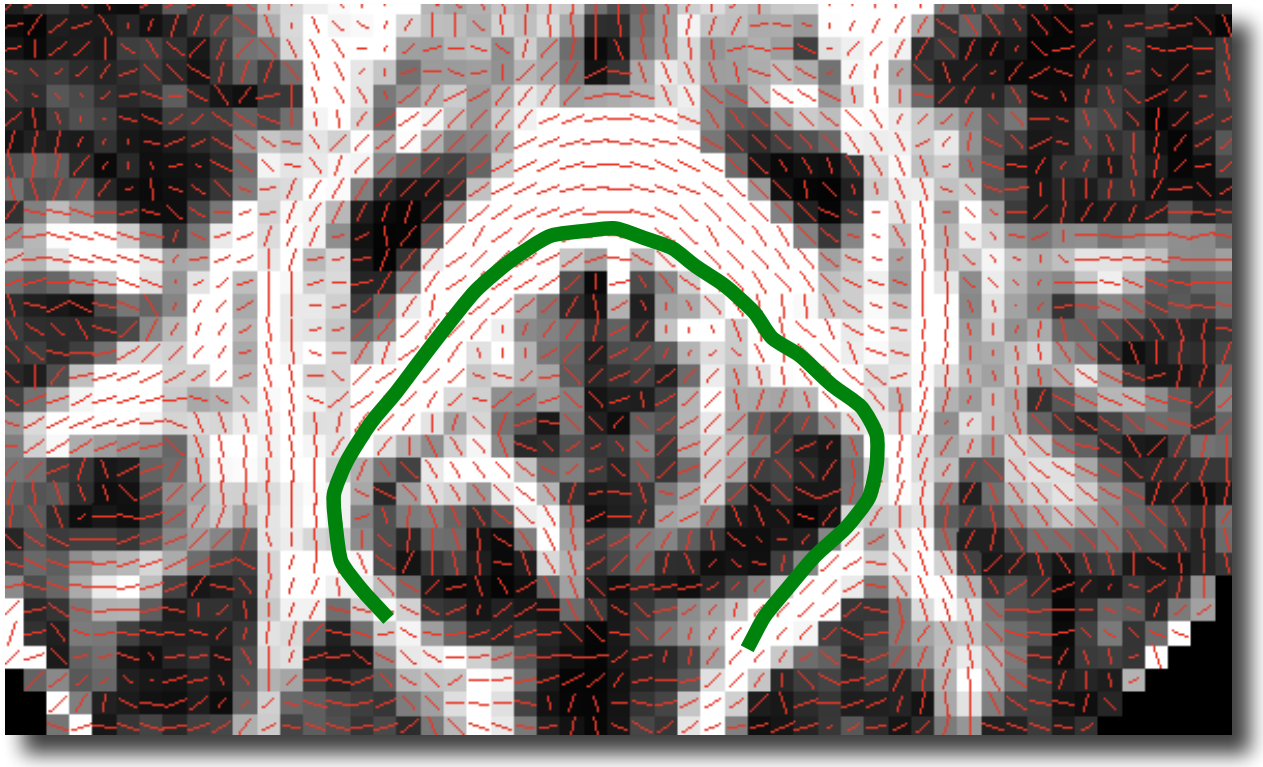
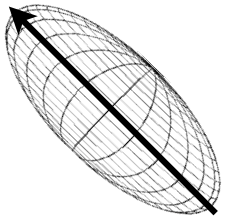
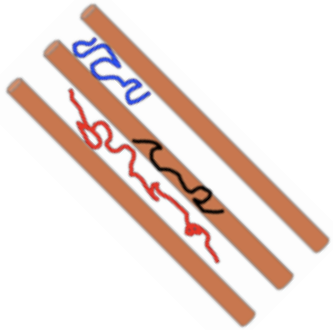
DTI tractography

$\mathbf{v}_1$ map
Principal Diffusion Direction



Principal Diffusion Direction

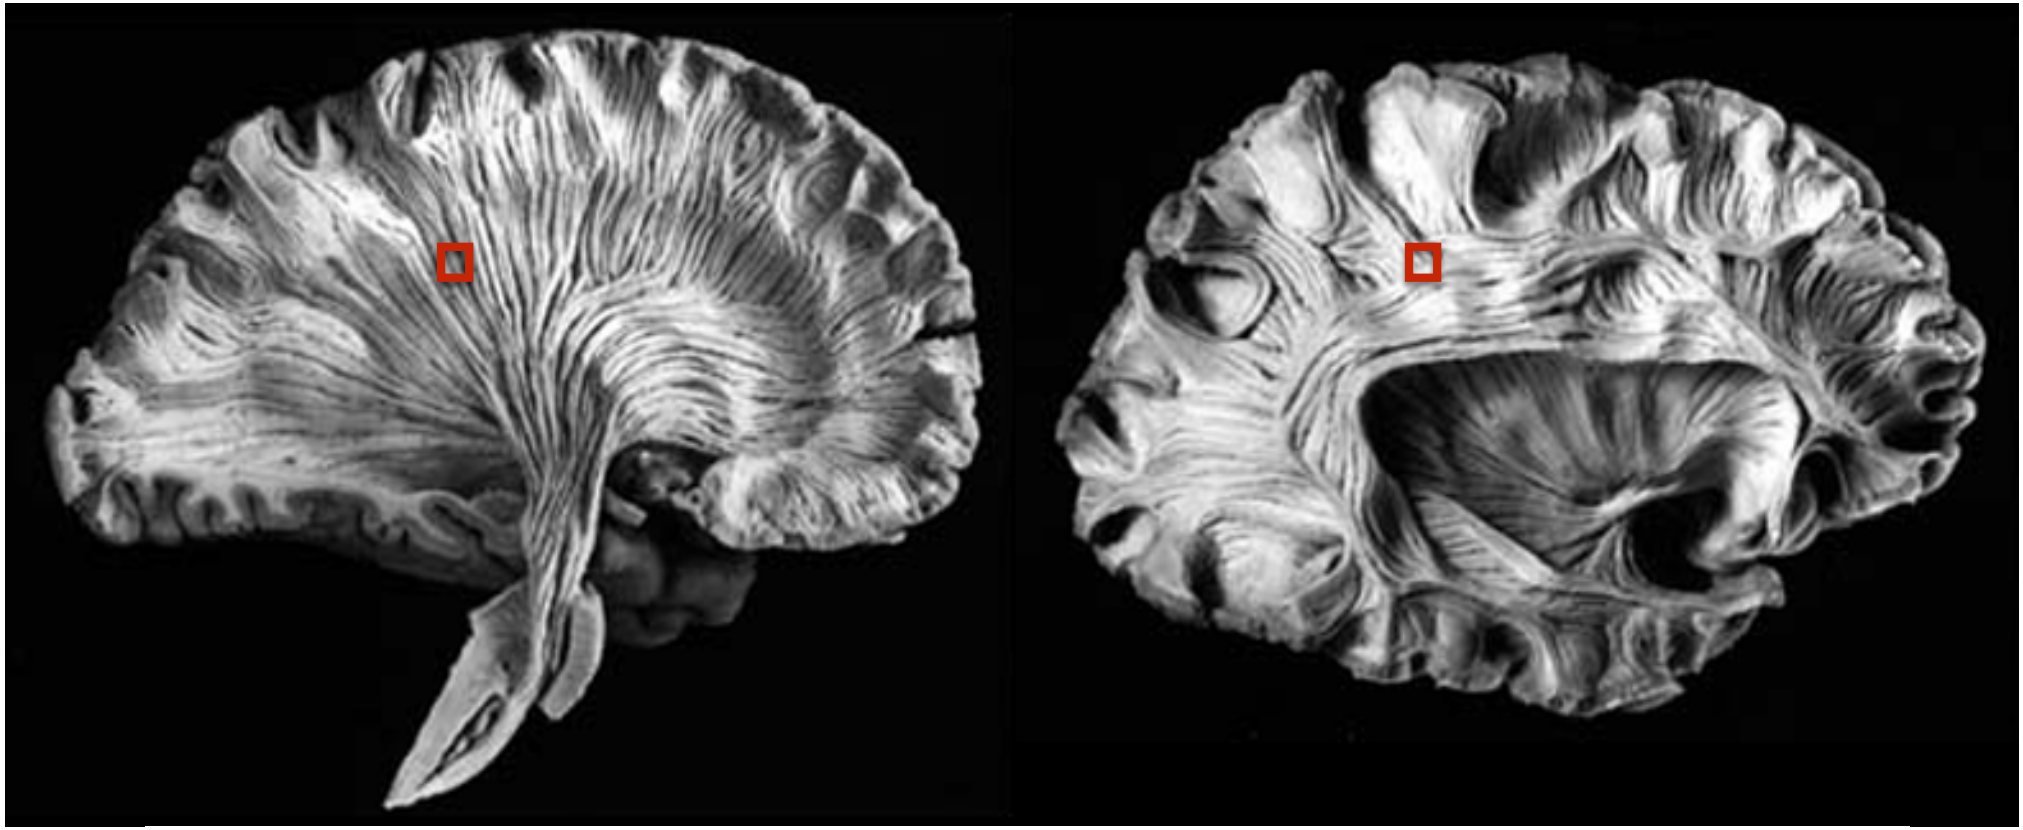




<u>Assumption</u>:

Direction of maximum diffusivity
(in anisotropic voxels)
is an **<u>estimate</u> of the major fibre orientation**.

But is WM always coherently organised within a voxel?



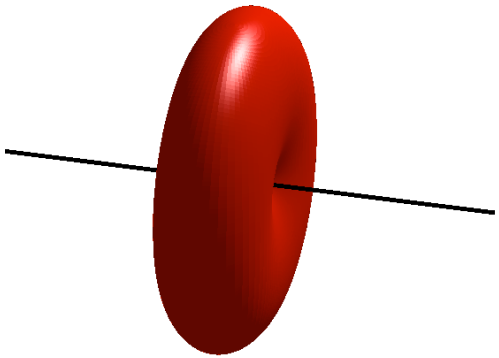
Unfortunately not, complex fibre patterns (e.g. crossings) are very common at the voxel scale.

Williams, Gluhbegovic, and Jew, "The Human Brain`; Dissections of the Real brain", Virtual Hopstital, Universitoy of Iowa, 1997

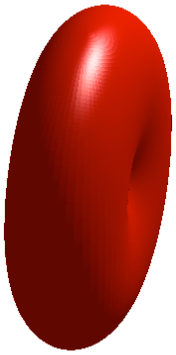
Predictions from the tensor model
no crossing fibres

One orientation

Measured Signal Shape



Predicted Signal Shape



DTI Ellipsoid

Prediction & Measurements in 2D

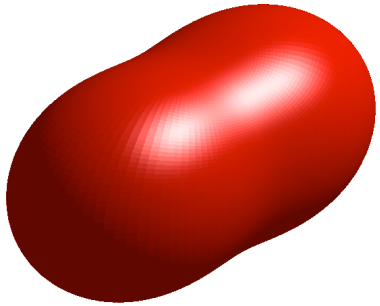
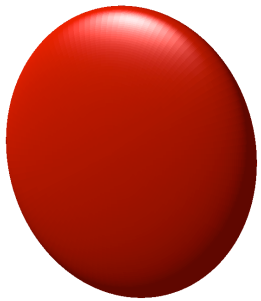
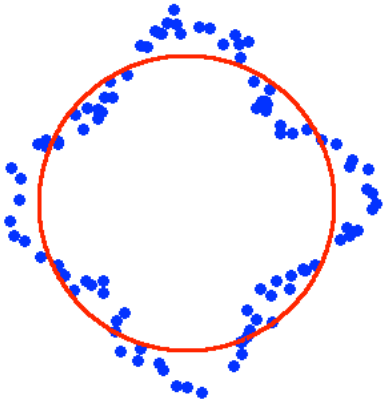
Predicted Signal Shape



DTI Ellipsoid



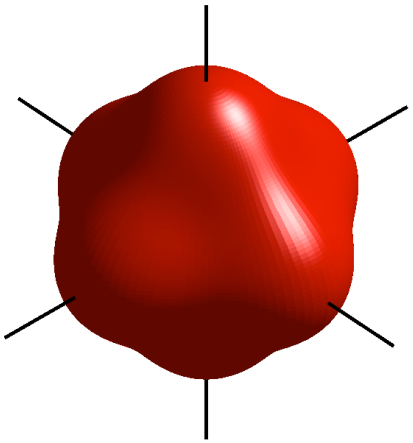
Prediction & Measurements in 2D



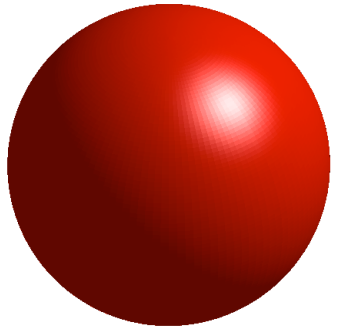
Predictions from the tensor model crossing fibres

Three Orientations

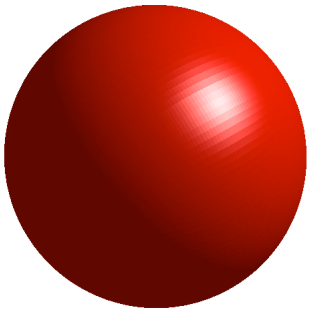
Measured Signal Shape



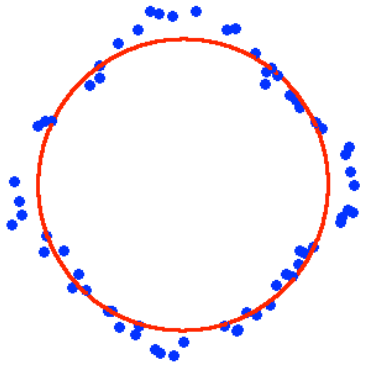
Predicted Signal Shape



DTI Ellipsoid



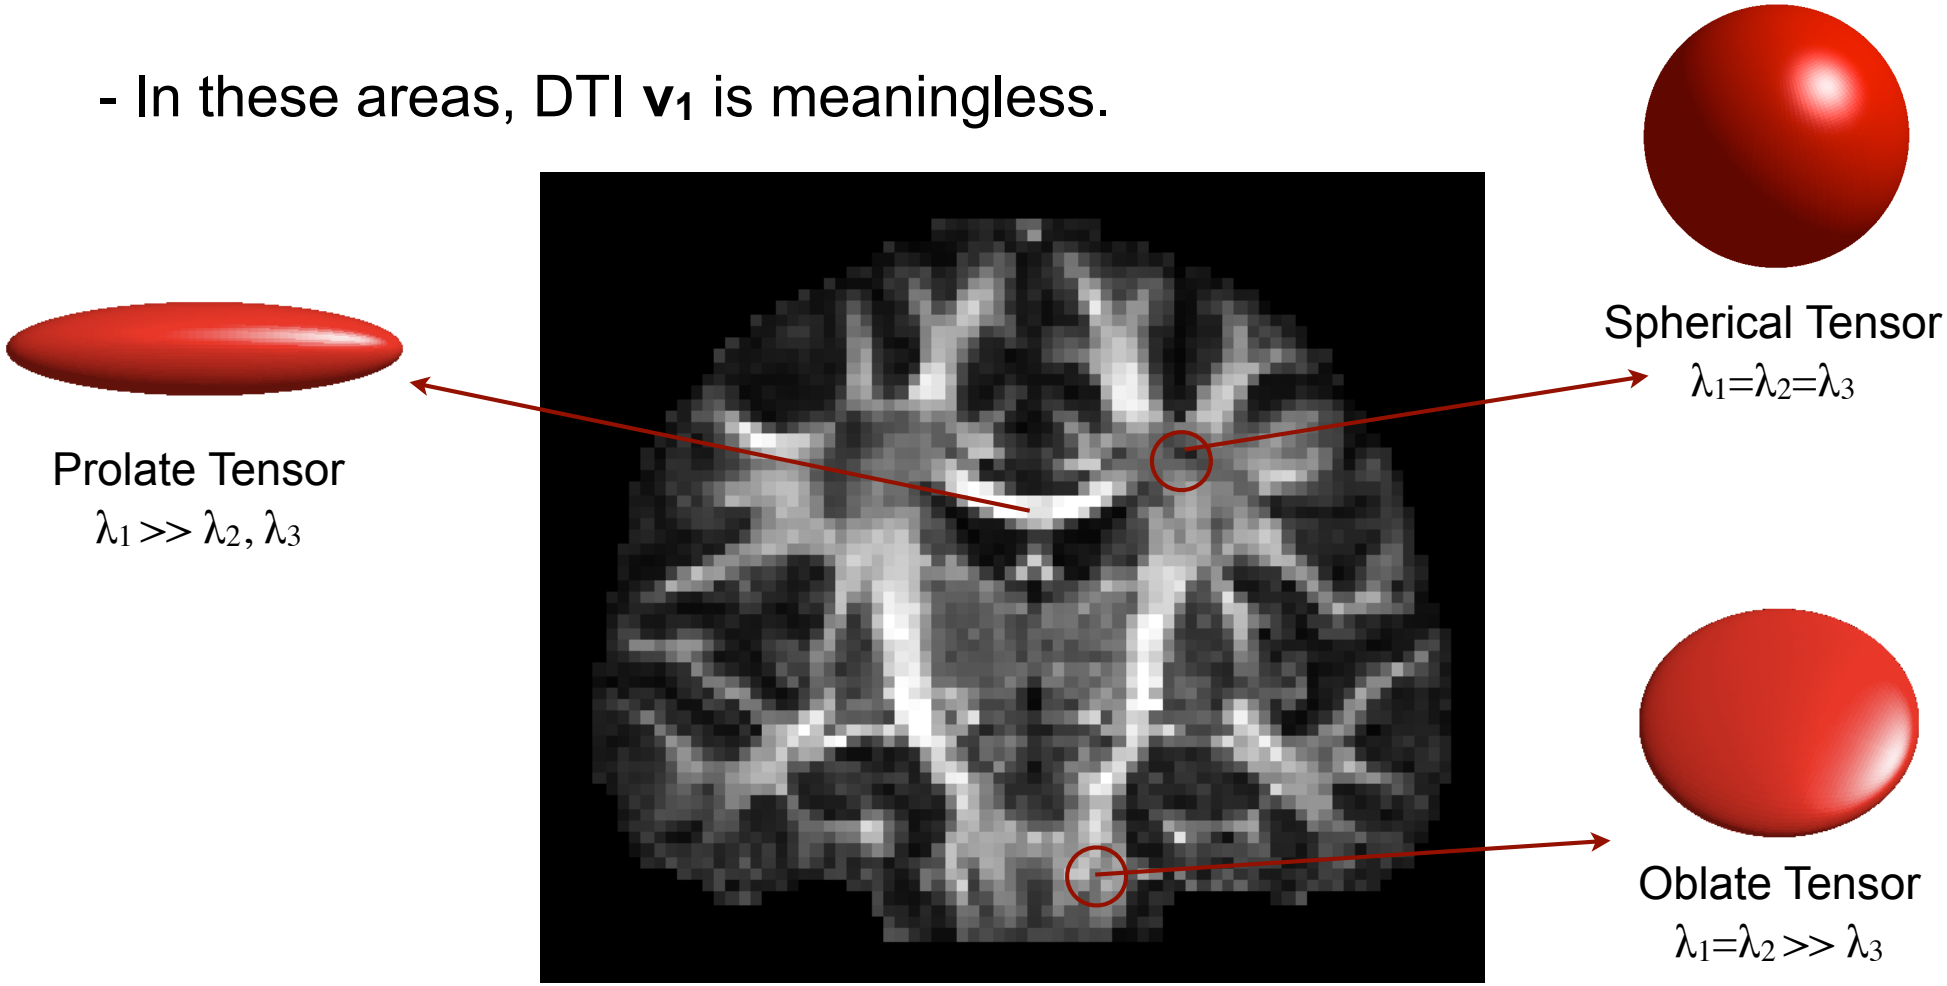
Prediction & Measurements in 2D



How good is the DTI Model in regions with crossing fibres?

- In voxels containing two crossing bundles, the tensor ellipsoid is pancake-shaped (oblate, planar tensor).
- In voxels containing three crossing bundles, the tensor ellipsoid is spherical.

- In these areas, DTI $\mathbf{v_1}$ is meaningless.

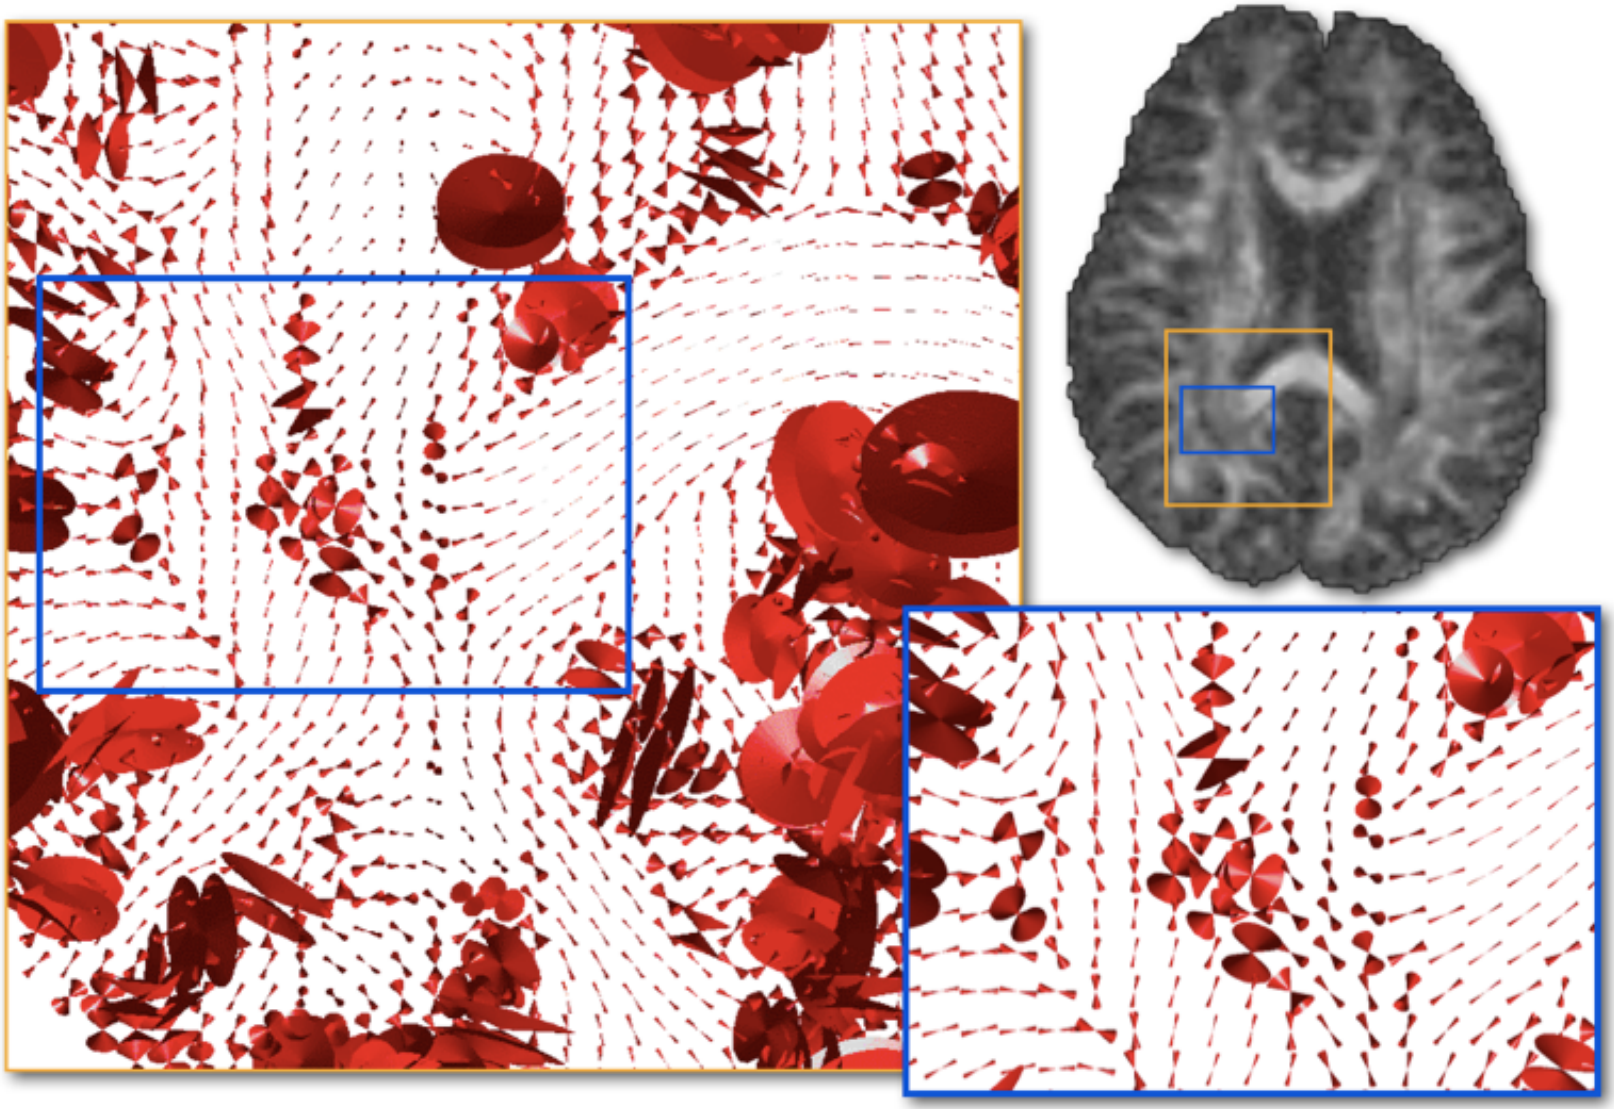


Uncertainty on DTI Fibre Orientation Estimates

Repeat an acquisition many times and obtain the variability in $\mathbf{v}_1$ from the different datasets.

Uncertainty Sources

- Modelling errors
- Noise



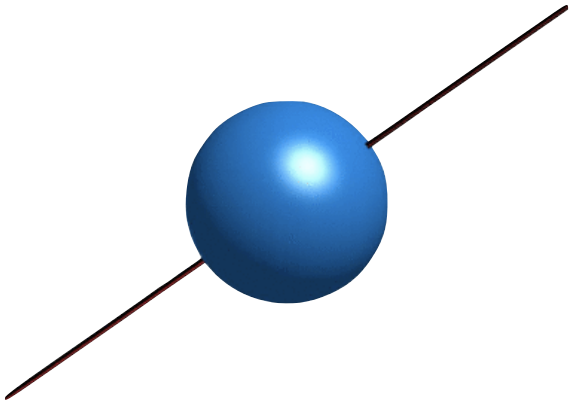
Cones of uncertainty on DTI $\mathbf{v}_1$

Jones, 2002

Do we have to use the DTI model to estimate orientations? Not really, many models exist

DTI model (dtifit)

Ball & sticks model (bedpostx)



$$s_j = s_0 [(1-f)\exp(-b_j\, d) + f \exp(-b_j\, d(\mathbf{x}_j^{\mathrm{T}}\mathbf{v})^2)]$$

Anisotropic Volume Fraction (unknown)

Diffusivity (unknown)

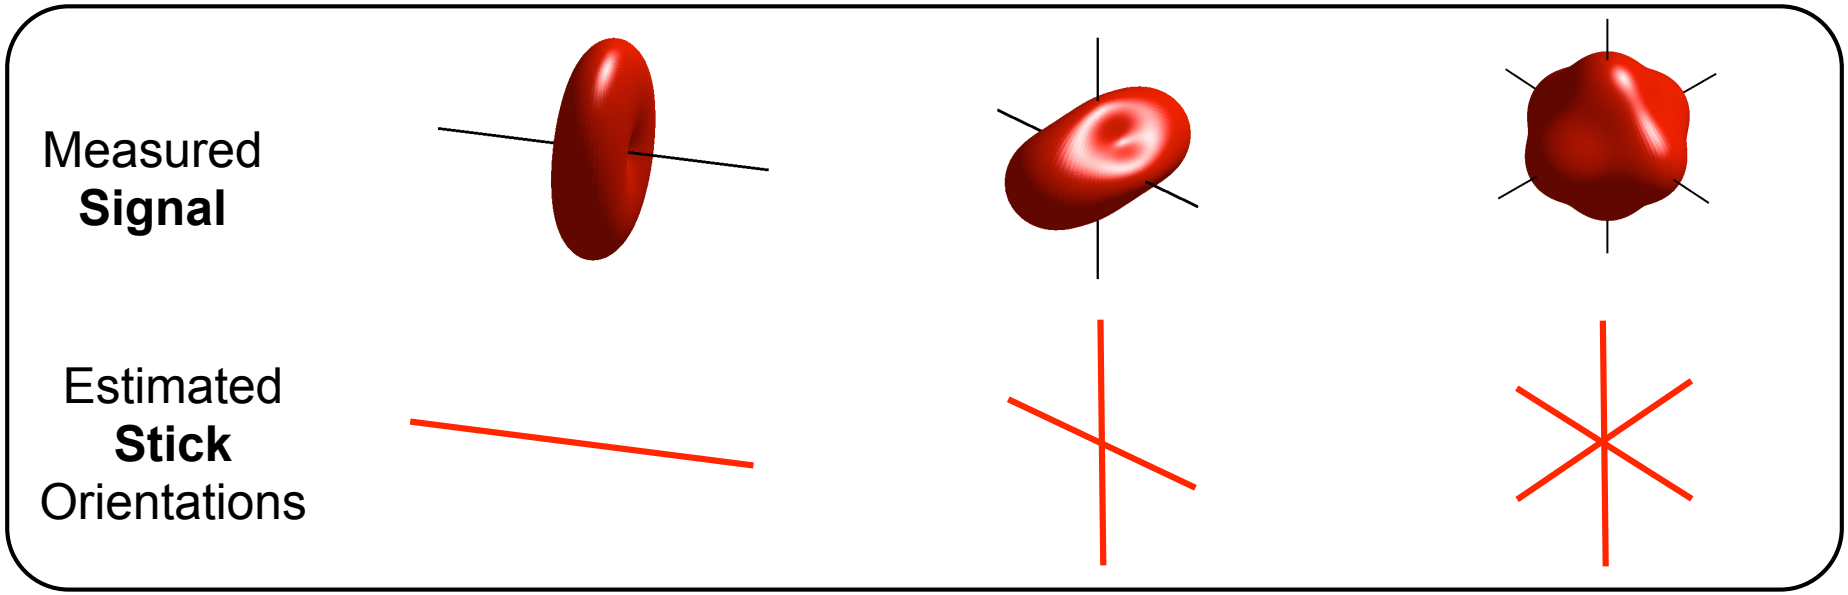
Fibre Orientation (unknown)

Measured Signal for Gradient *j*

b-value for gradient *j* (known)

Unit vector representing the direction of gradient *j* (known)

Ball & Sticks Model
Unlike the DT model, it can represent many orientations



- Anisotropic tensors (sticks) with isotropic background (ball)
- Fibre Orientations modelled explicitly and separated from isotropic partial volumes

Anisotropic Volume Fractions (unknown)

Diffusivity (unknown)

Max number of sticks (user-defined)

Fibre Orientation (unknown)

$$s_j = s_0 \left[(1-\Sigma f_n)\exp(-b_j\, d)+\Sigma f_n \exp(-b_j\, d(\boldsymbol{x}_j^{\mathrm{T}}\boldsymbol{v}_n)^2)\right]$$

Measured Signal for Gradient *j*

b-value for gradient *j* (known)

Unit vector representing the direction of gradient *j* (known)

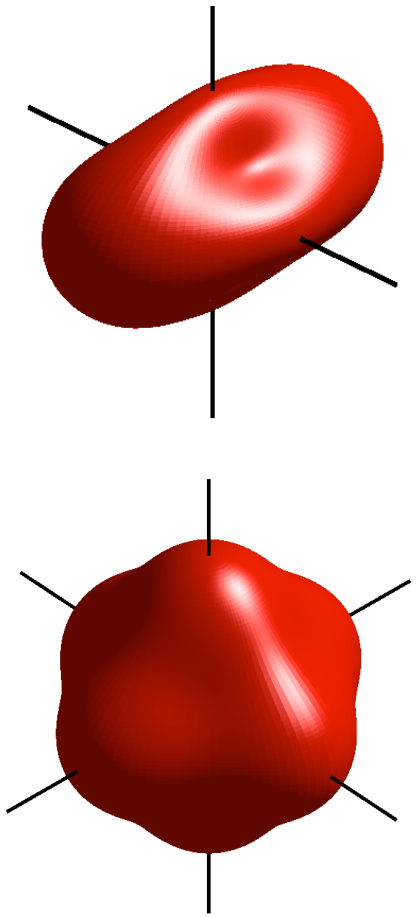
Predictions from the ball and sticks model crossing fibres

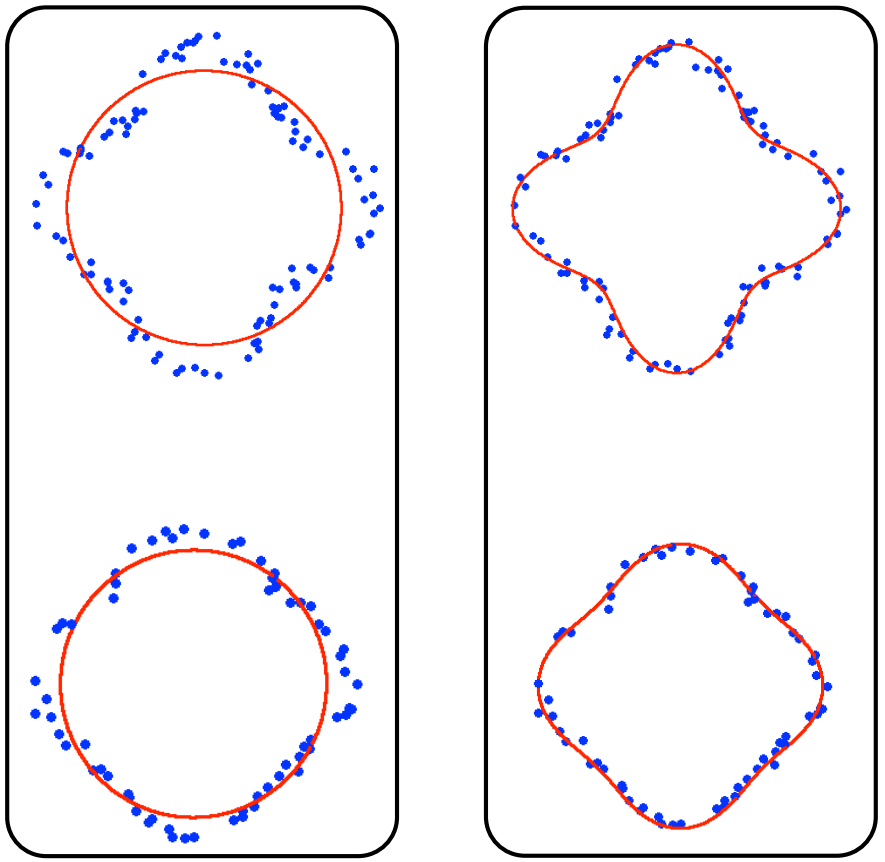
Measured Signal Shape

Prediction & Measurement in 2D

Two orientations

Three orientations

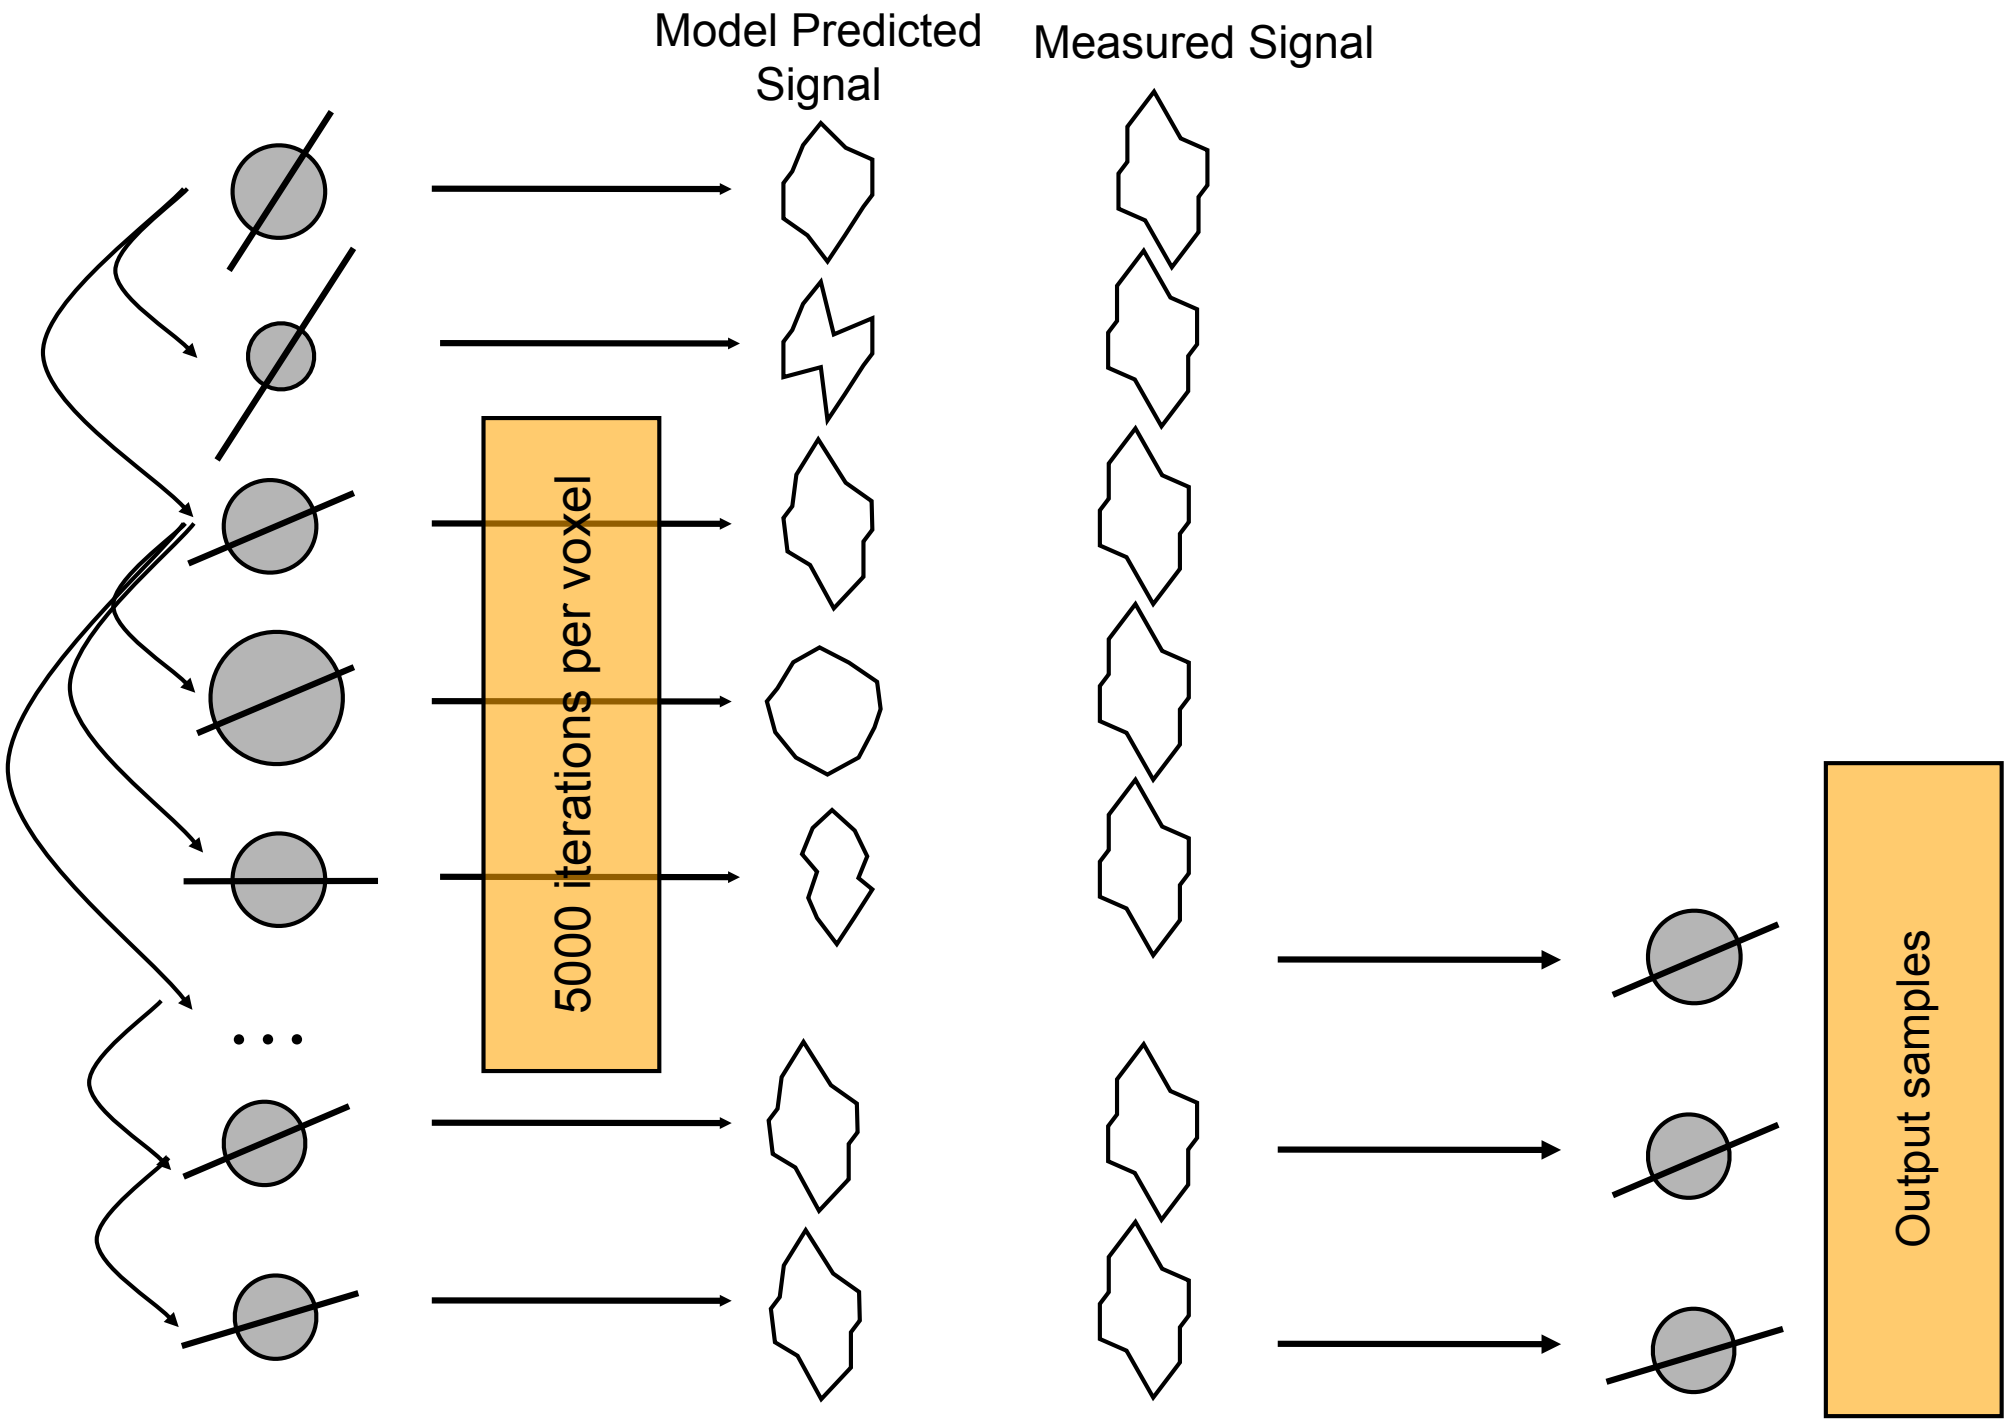




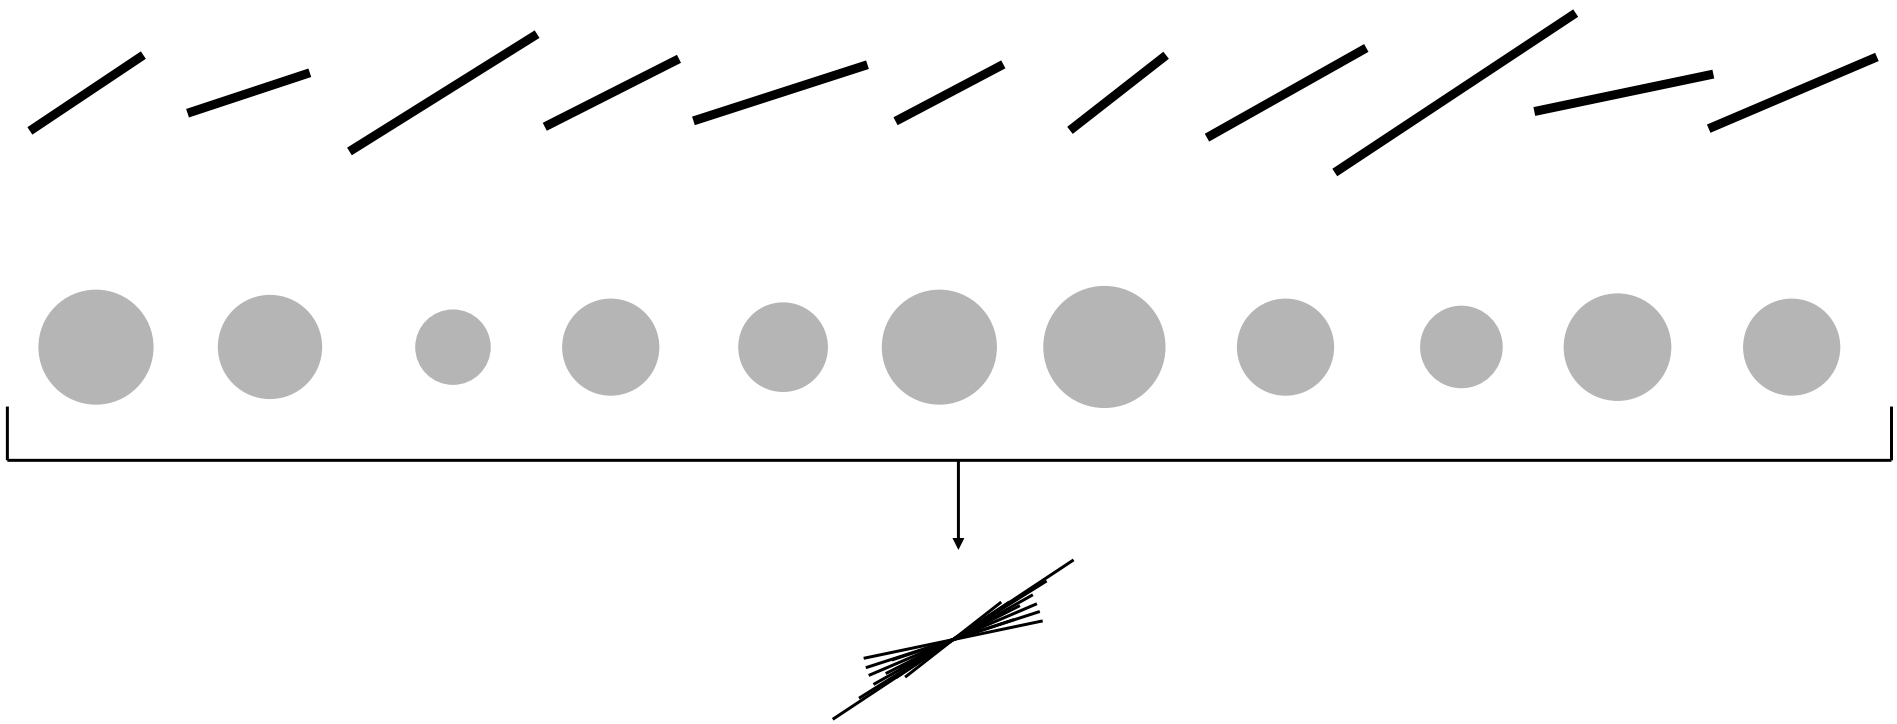
How can we estimate uncertainty?

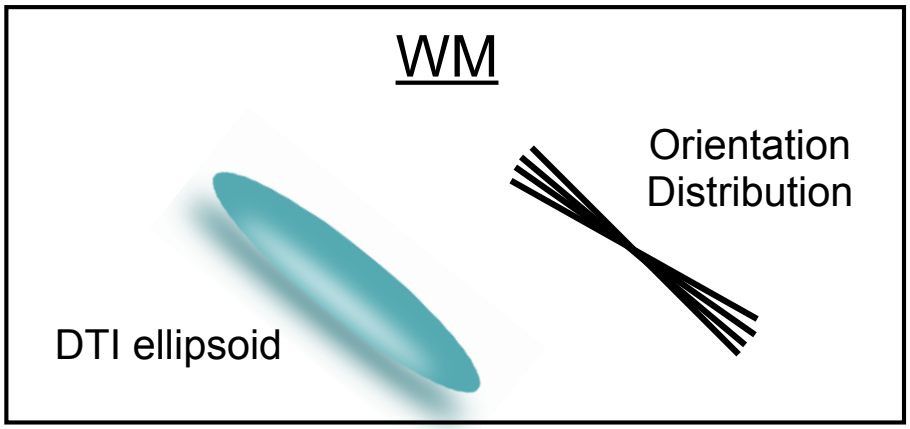
- Remember ... a long time ago in the world of fMRI ...
- We estimated two things:
  - A cope file (the parameters)
  - A varcope file (uncertainty in these parameters)
- We estimated our parameters, and their uncertainty from a single dataset.
- Can we do a similar thing with parameters estimated for the ball & sticks model?
  - In the context of GLM, we have analytic formulas
  - For diffusion (especially orientations) we don't

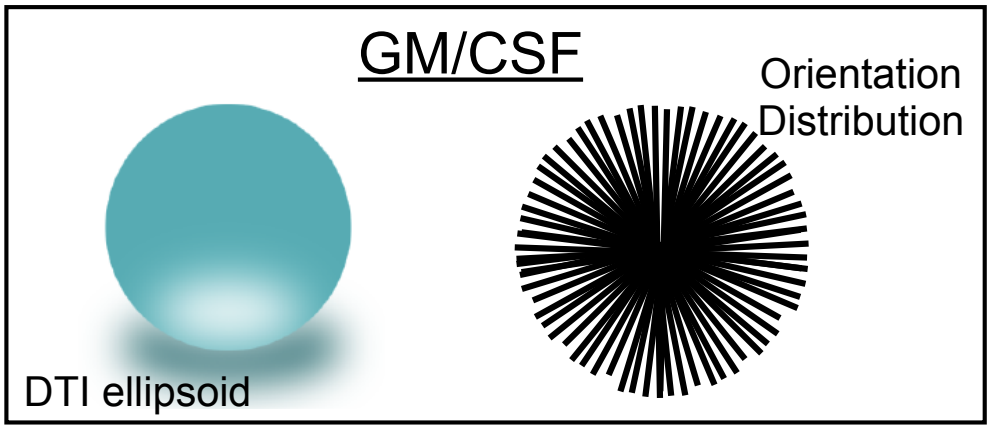
Markov Chain - Monte Carlo (MCMC) Sampling



Output in Each voxel = Distributions of Parameters

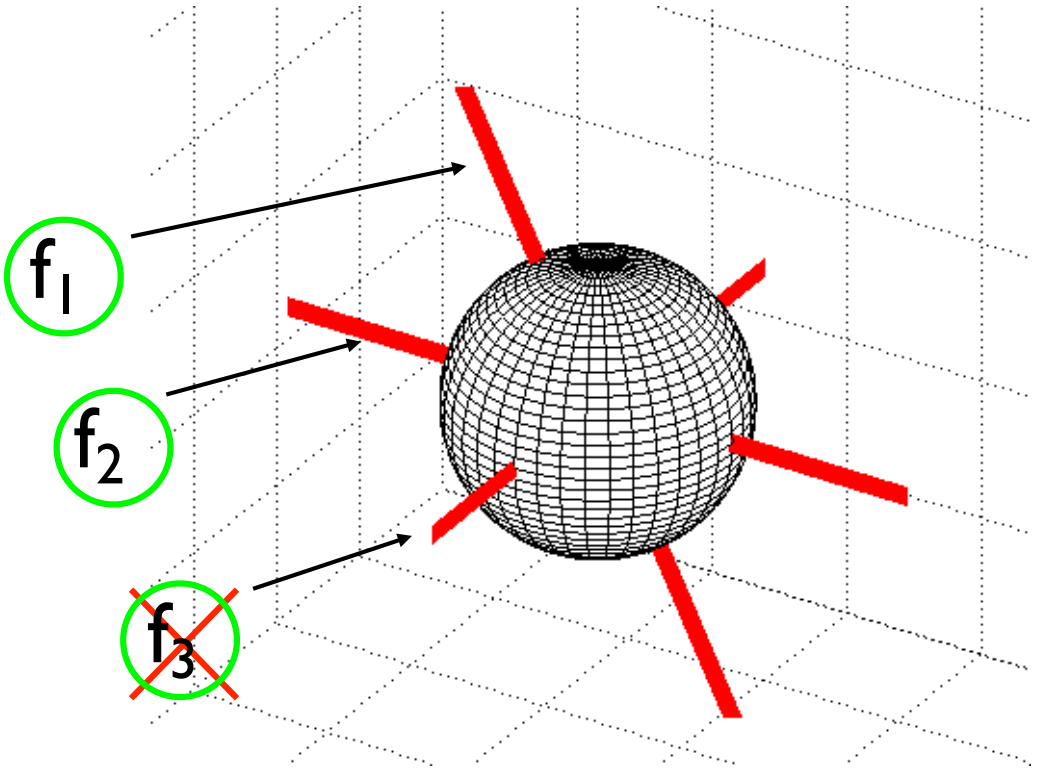






Ball & Sticks Model Selection

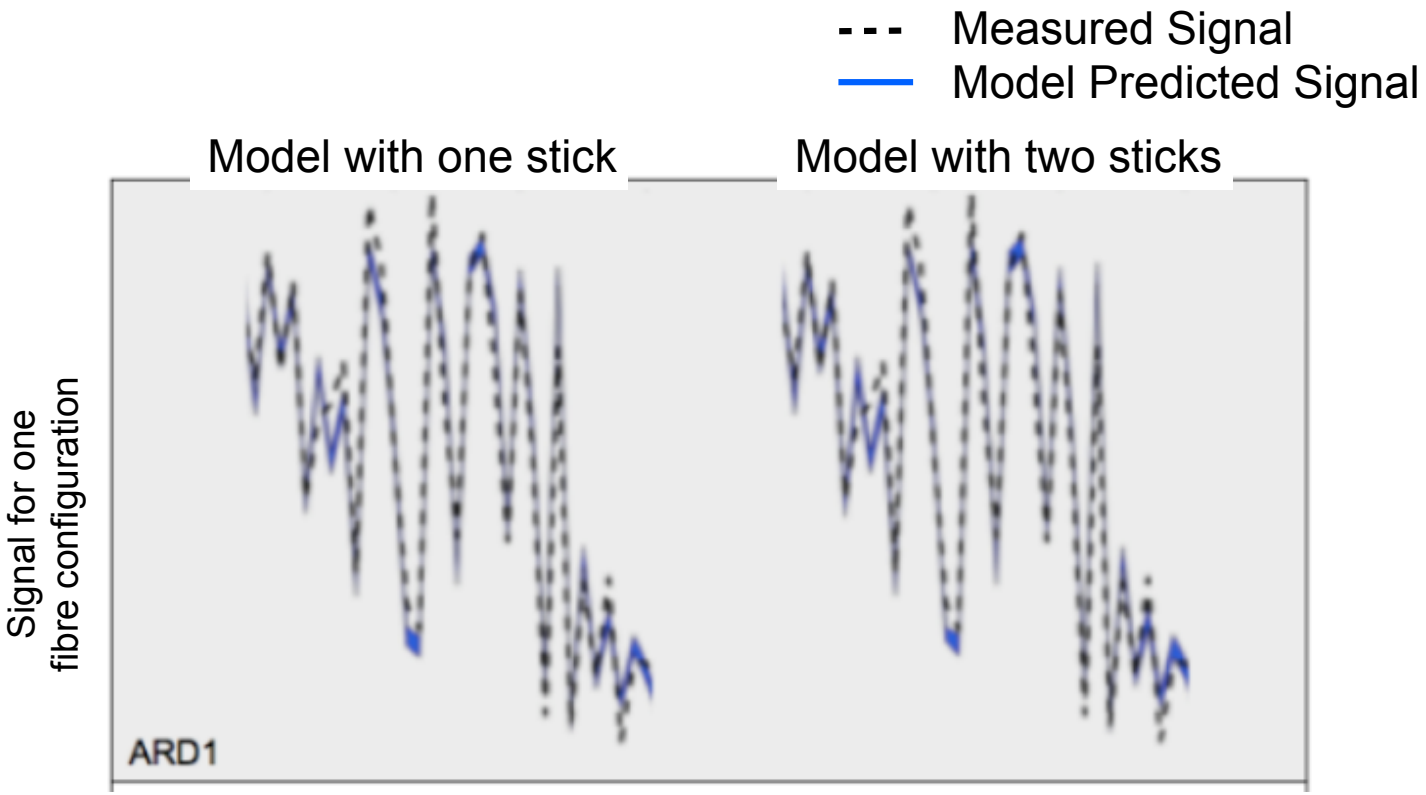
- Model selection problem: One, two or more fibres within a voxel?
- Automatic Relevance Determination: Only estimate complexity that is supported by the data



Modelling Complex Fibre Architectures

Automatic Relevance Determination (A.R.D.)

- No benefit from including a 2nd fibre => 2nd volume fraction goes to zero

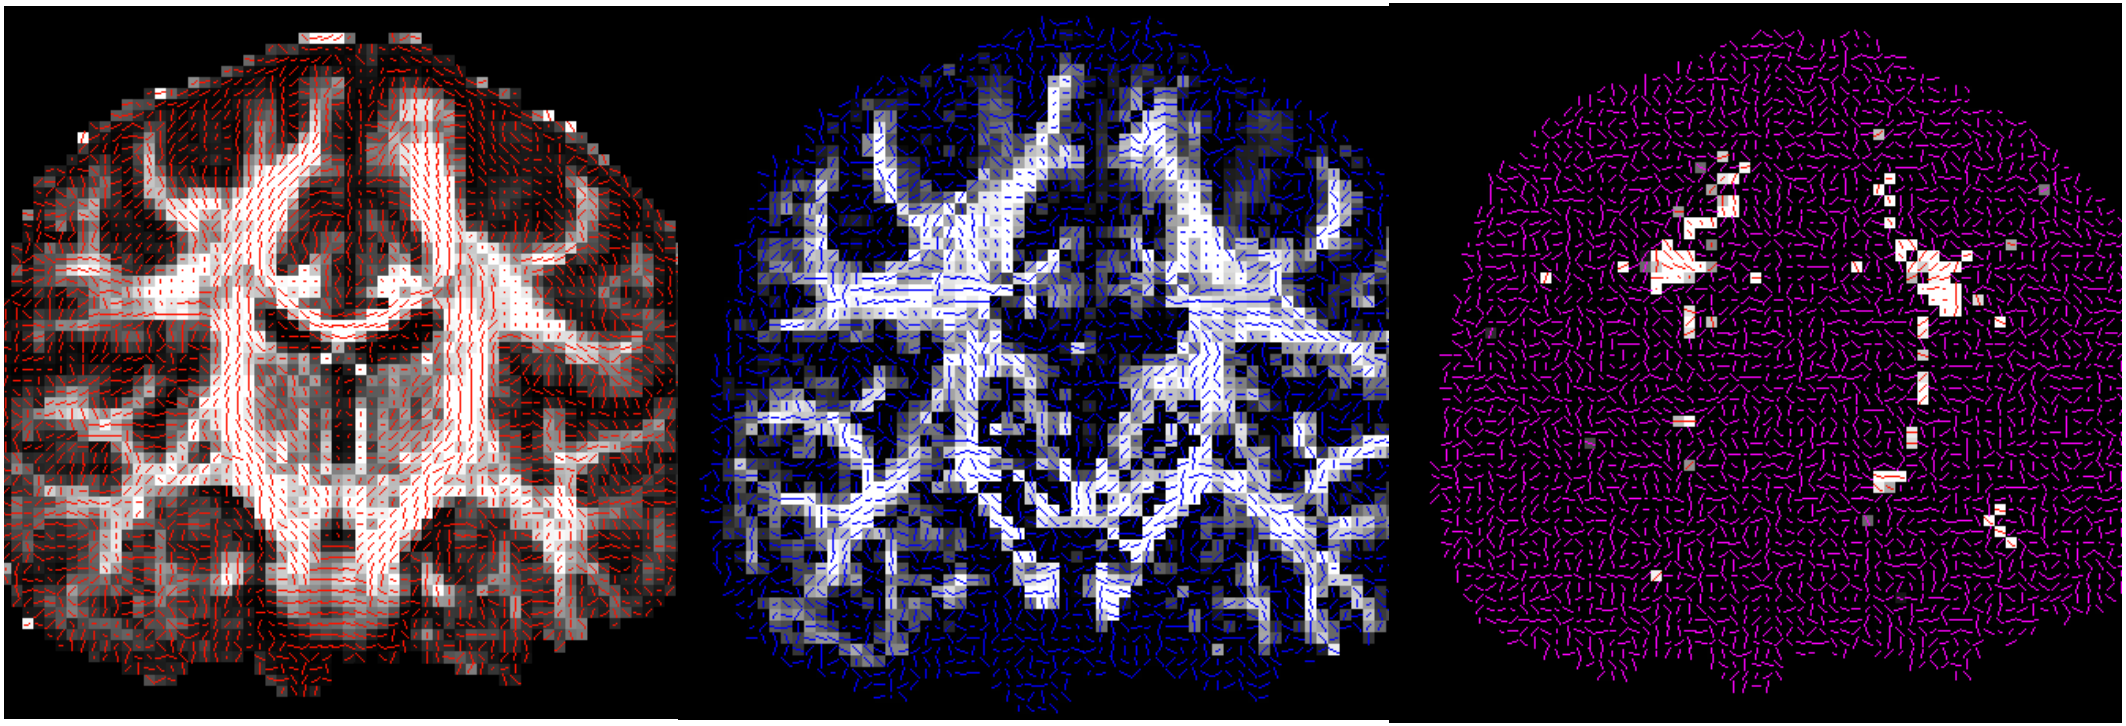


Modelling Complex Fibre Architectures

Automatic Relevance Determination (A.R.D.)

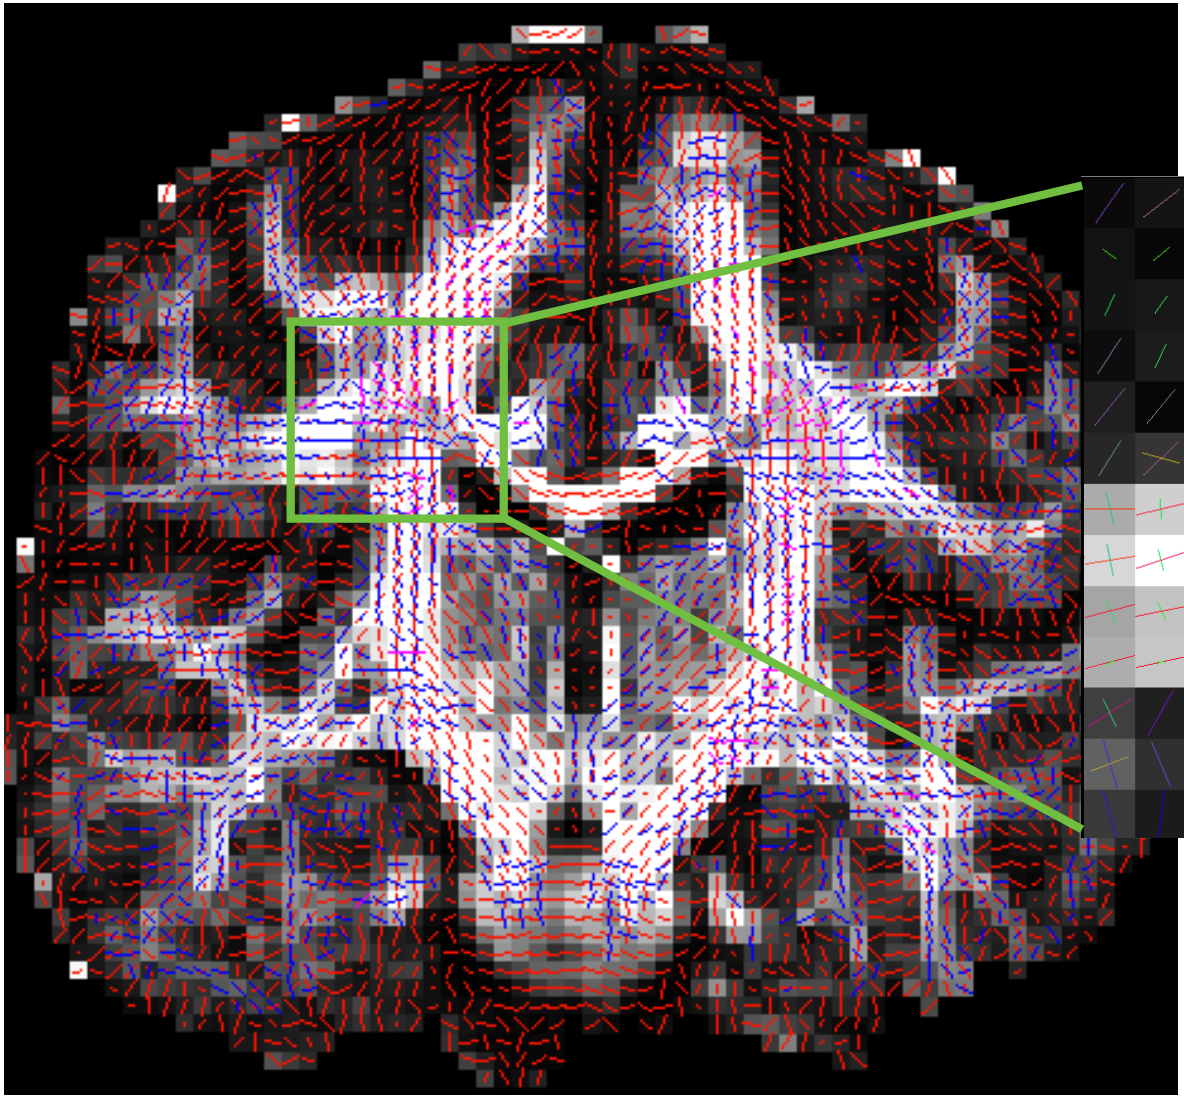
- After running BedpostX all voxels will have estimated parameters for the maximum number of sticks requested.
- But due to ARD, the sticks that are not supported in a voxel will have an almost zero volume fraction.
- We use a threshold (e.g. >5%) to **exclude sticks with tiny volume fraction**.

Stick1 Stick2 Stick3

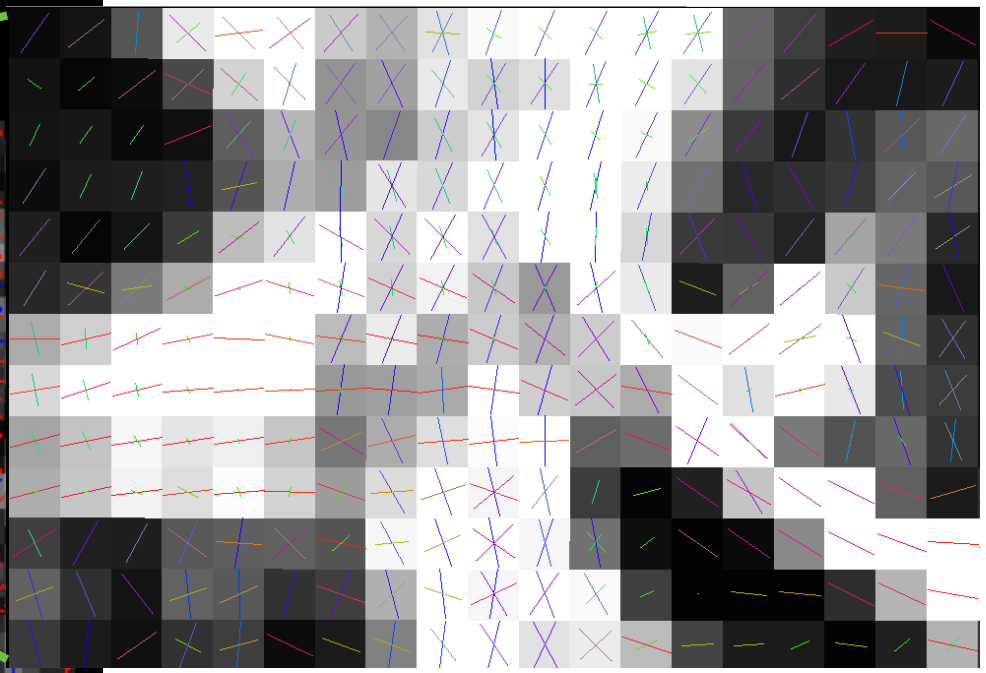


Ball & Sticks Orientations

All sticks, with secondary ones thresholded (f_n>5%)

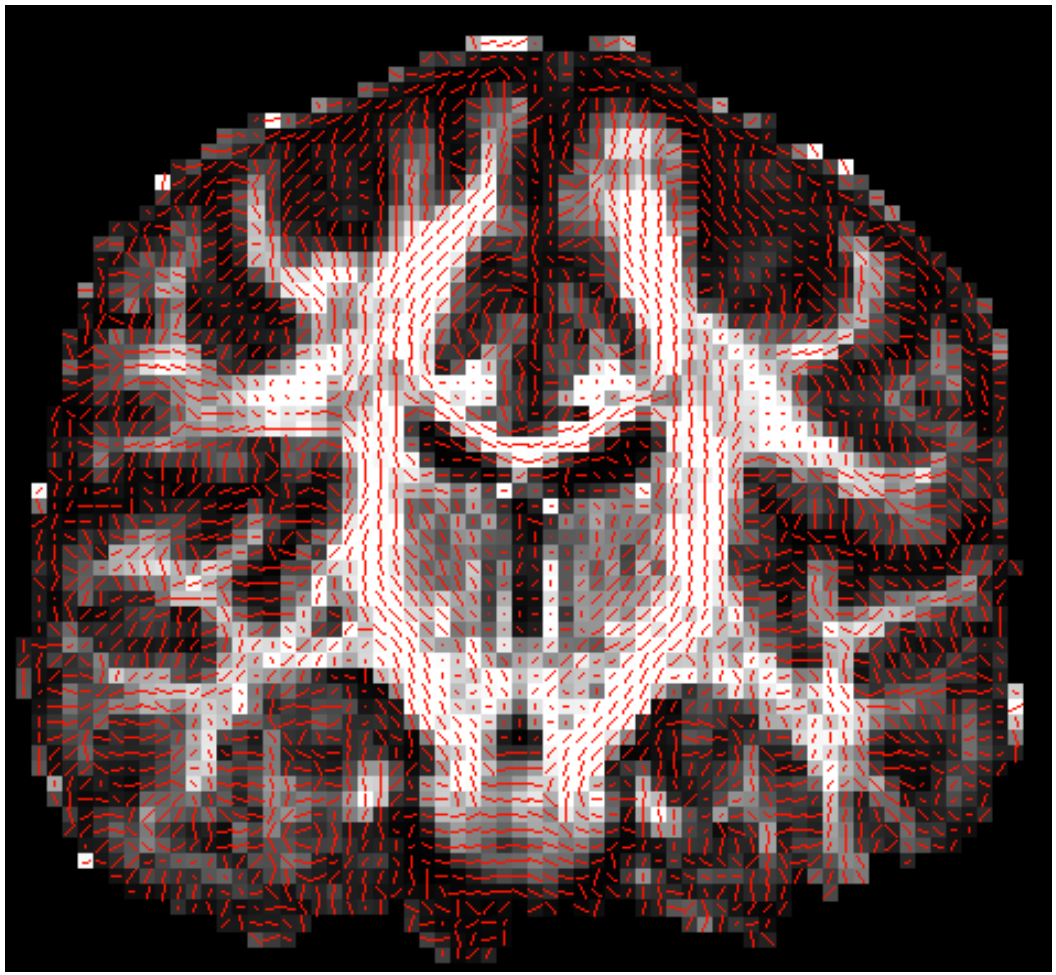


Orientations RGB-colour coded

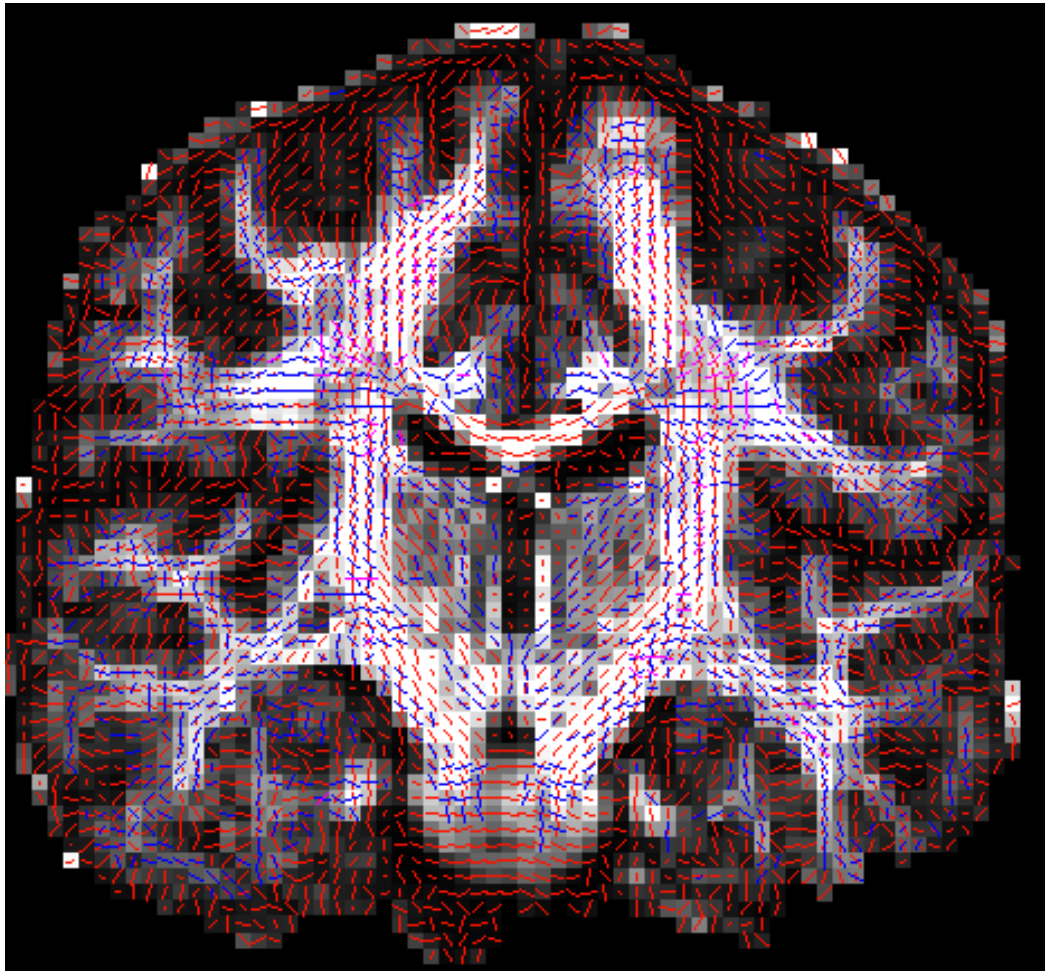


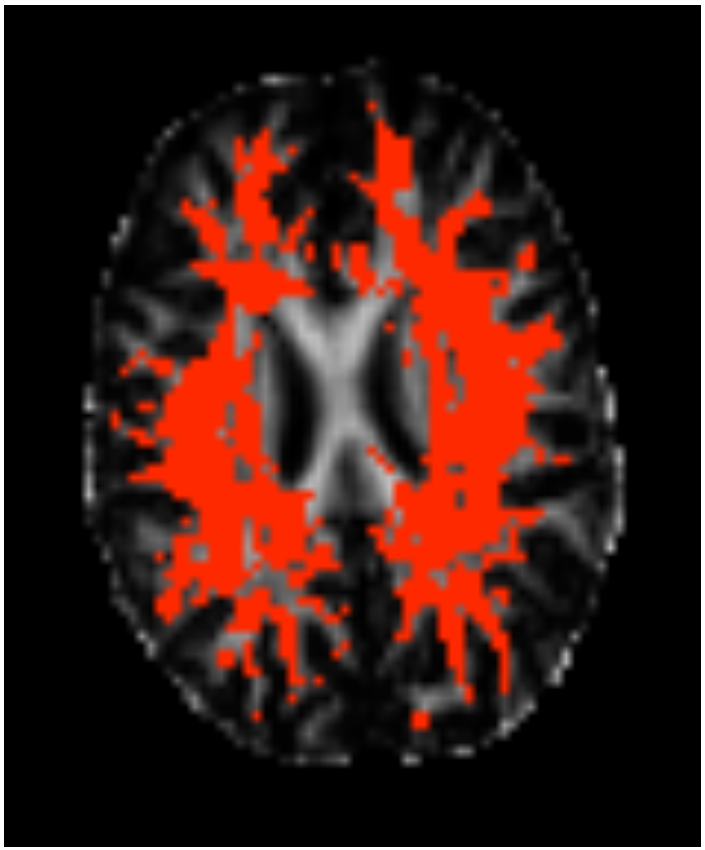
DTI vs Ball & Sticks Orientations

DTI

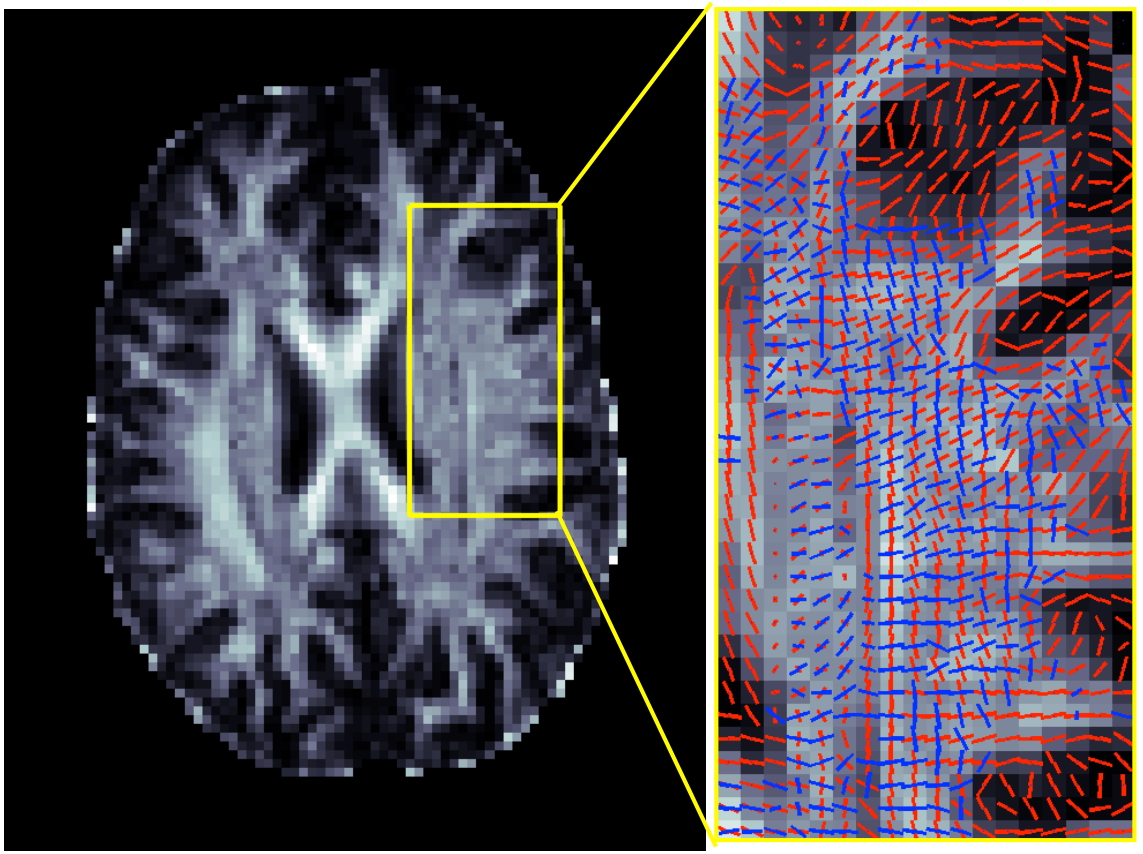


Ball & Sticks





A large portion of the WM supports crossing fibres



Coherence in orientations shows that we are not over-fitting (the ARD works)

Multi-Shell Diffusion Acquisitions
Why bother?

One Orientation

Two Orientations

Three Orientations

Signal at different b values (s/mm^2)

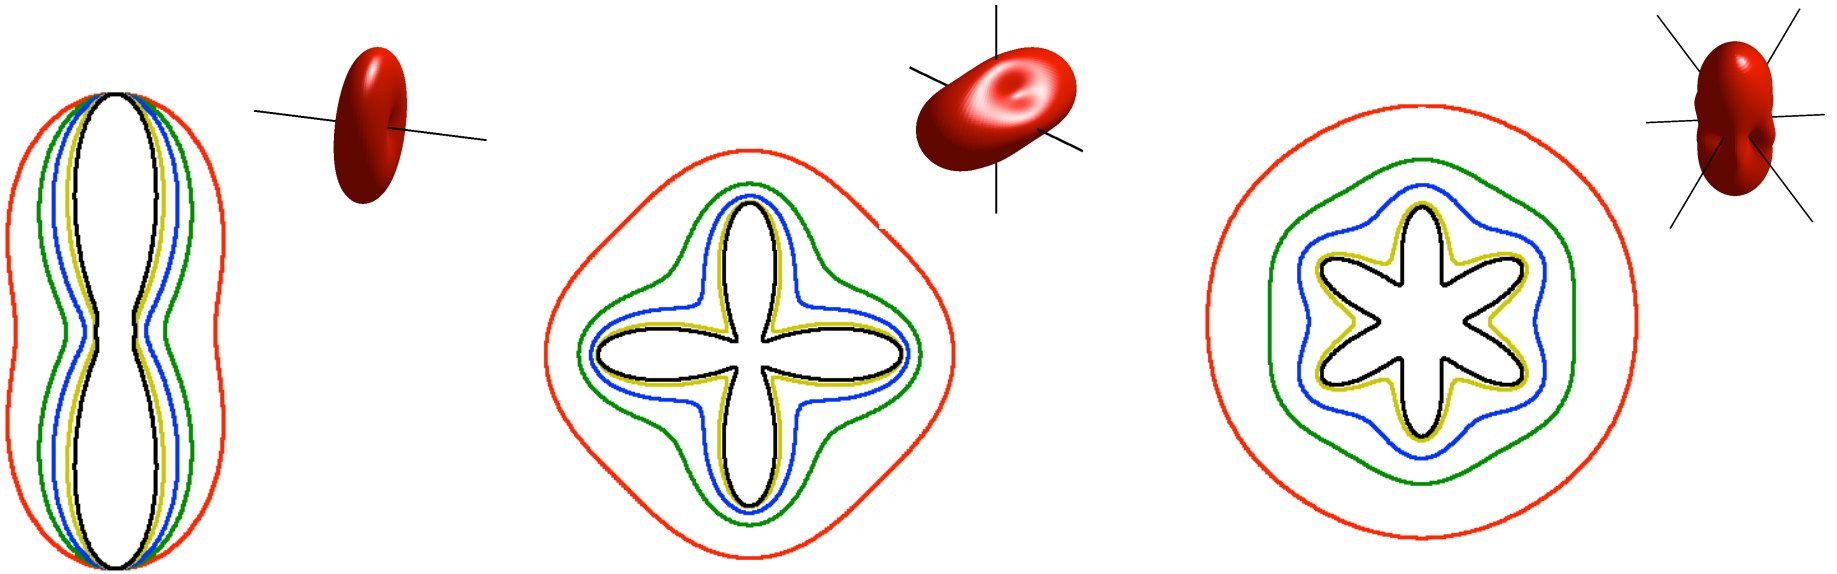
b=1000

b=2000

b=3000

b=4000

b=5000



Higher b value gives us more angular contrast!!!

Multi-Shell Diffusion Acquisitions
Why bother?

One Orientation

Two Orientations

Three Orientations

Signal at different b values (s/mm^2)

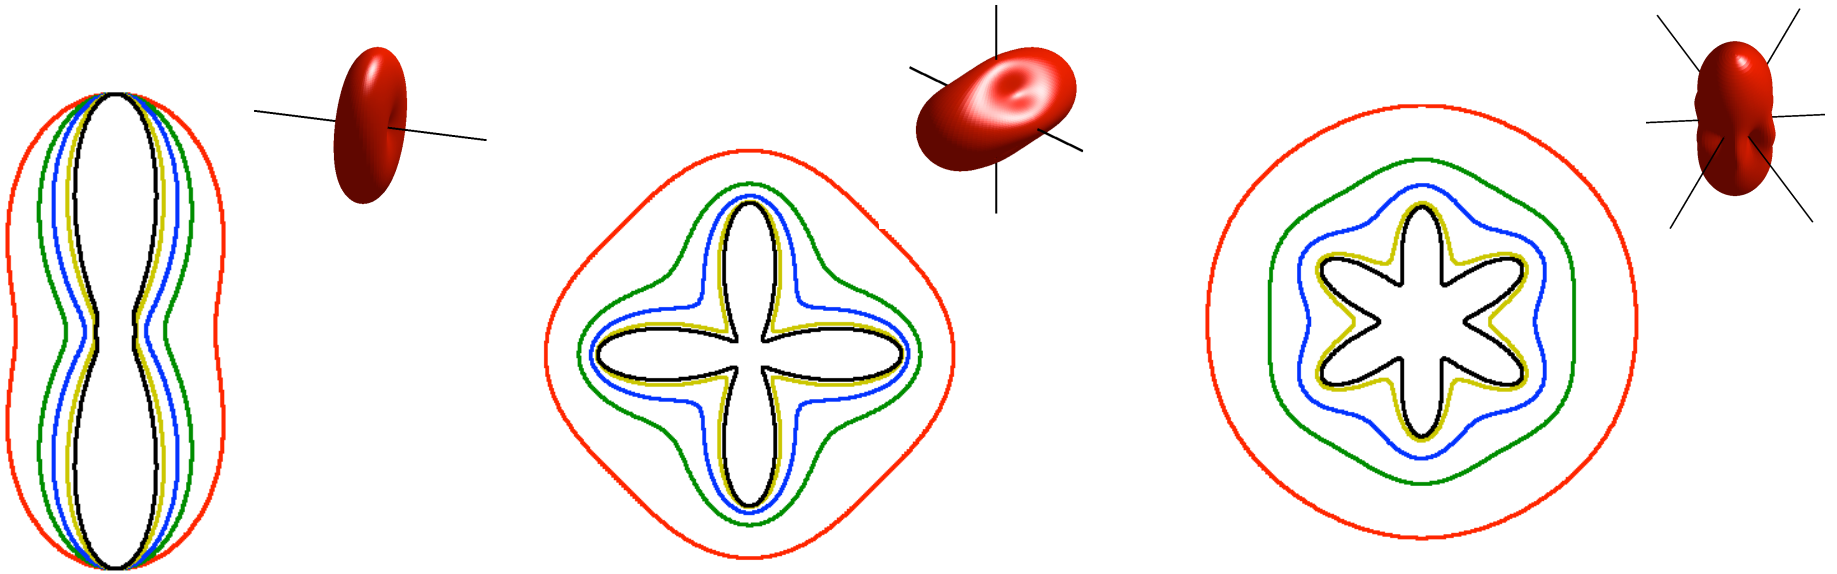
b=1000

b=2000

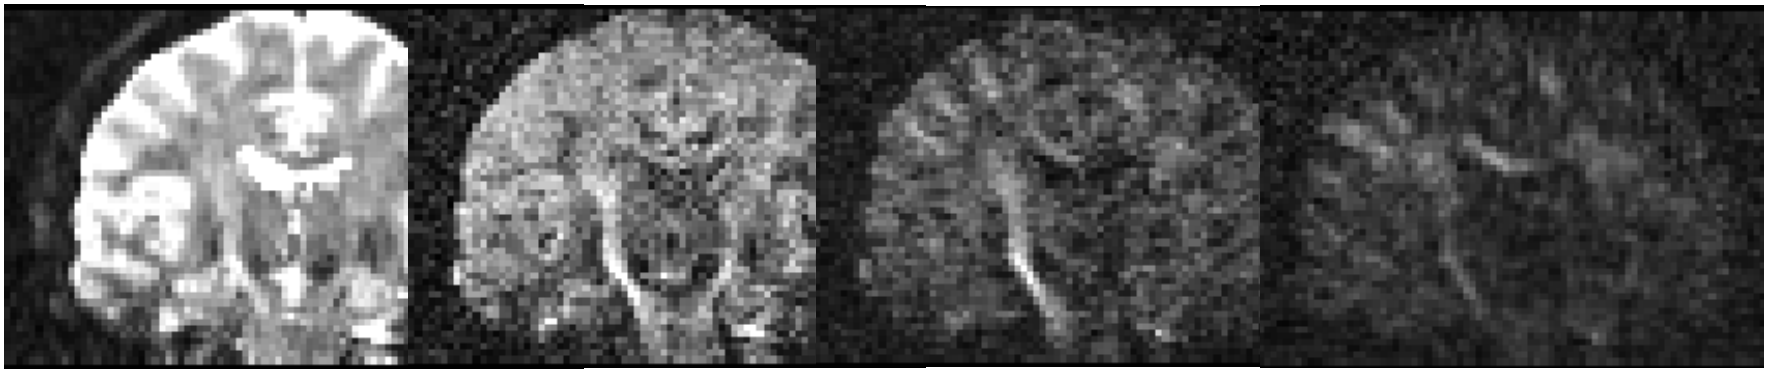
b=3000

b=4000

b=5000



b=300 b=1000 b=2000 b=3000



But SNR goes down very quickly with b…

Generalised Ball & sticks Model
Gets best of both worlds

- Multi-shell model (or model=2) in Bedpostx options.
- Allows representation of multiple diffusivities within a voxel (rather than just one).
- More accurate model for multi-shell data & partial volume effects.

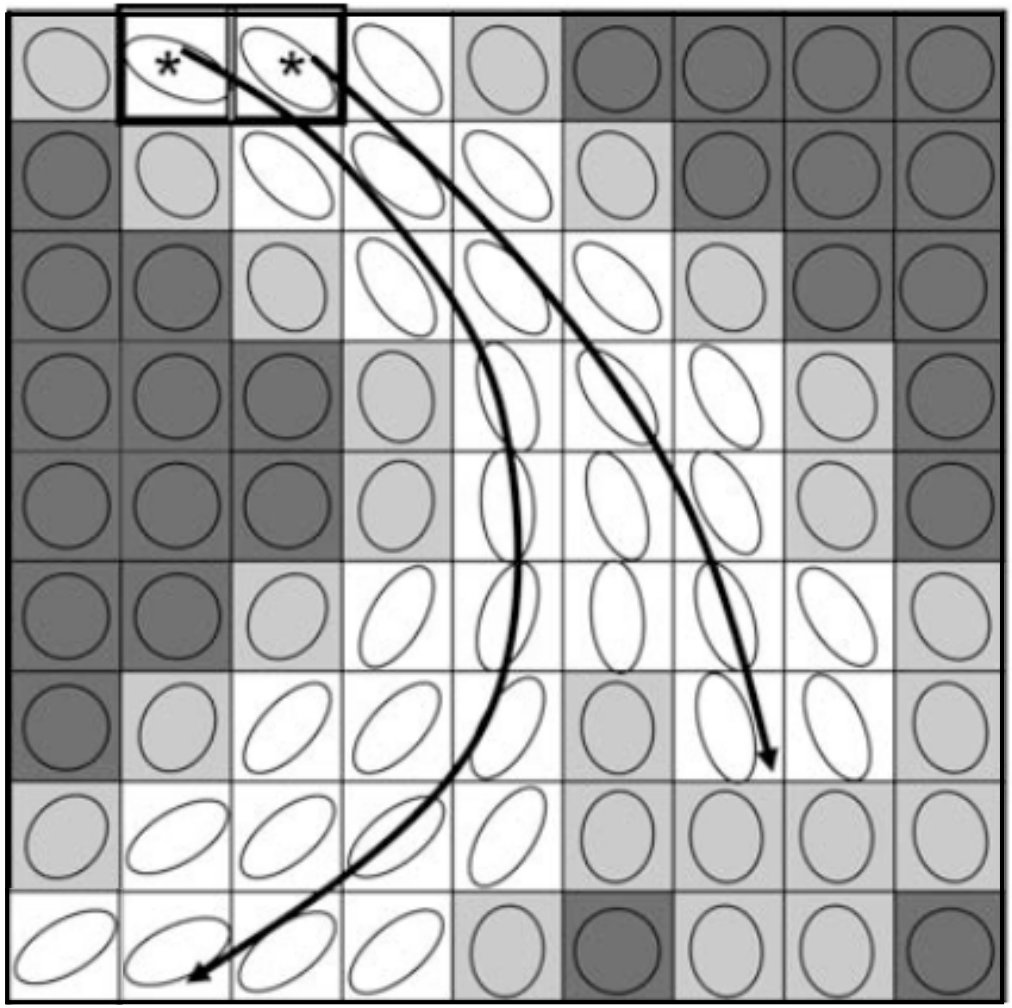
DTI Streamline Tractography



Mori S, Neuron 2006

Formally, we solve numerically the differential equation:

$$\frac{d\mathbf{r}(s)}{ds} = \mathbf{v_1}(\mathbf{r}(s)), \quad \mathbf{r}(0) = \mathbf{r}_0$$

Position along a curve

Principal eigenvector $\mathbf{v_1}$ at position $\mathbf{r}(s)$

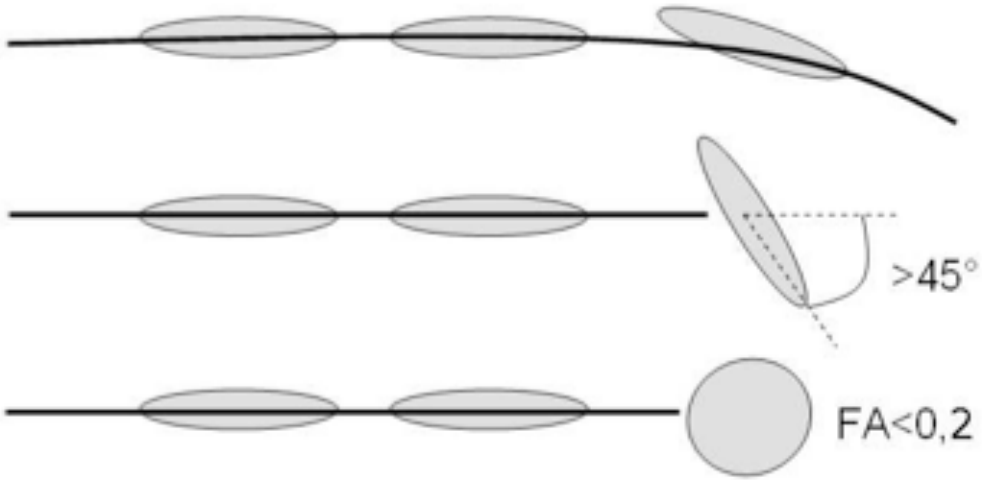
Starting Position

DTI Streamline Tractography

But When to Stop?
Heuristics to avoid error propagation.
+ Knowledge of the anatomy

Curvature Change Threshold: To avoid crossings of boundaries and very bended trajectories, impose a smoothness criterion.

Anatomical criteria (e.g. reach grey matter)



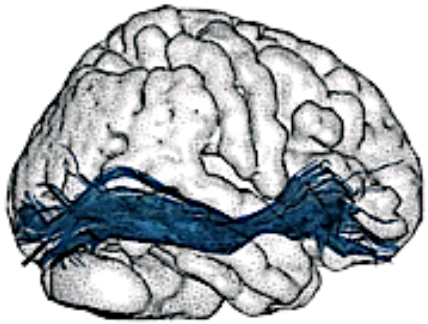
Streamline tractography can dissect major bundles

arcuate fasciculus

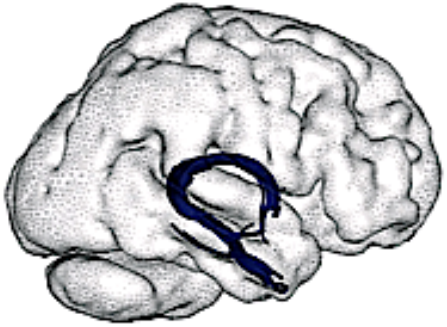
cingulum bundle

inferior longitudinal fasciculus

corpus callosum

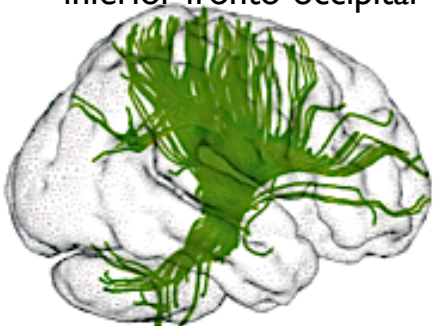


inferior fronto-occipital



fornix

uncinate fasciculus



corona radiata

cerebellar tracts

Catani and Thiebaut de Schotten 2008

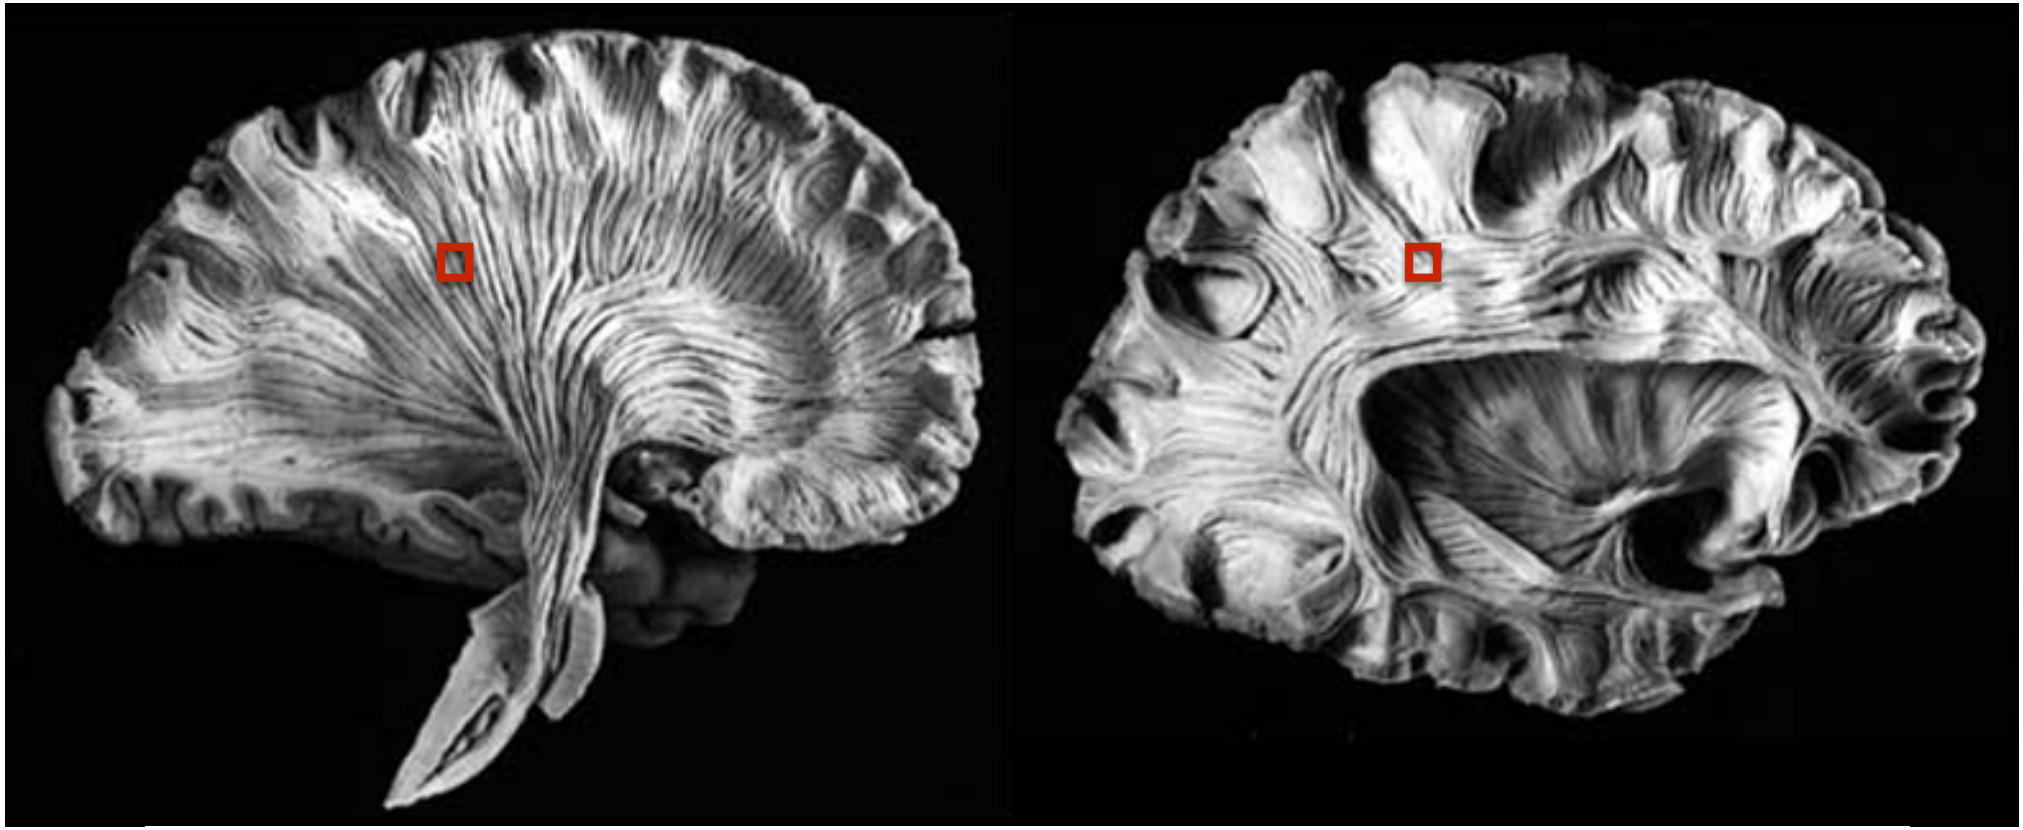
DTI Streamline Tractography Summary

- Use the major axis of the DTI ellipsoid as a fibre orientation estimate.

- Propagate curves within this vector field until empirical thresholds are exceeded.

- Major fibre bundles can be reconstructed.

But is WM always coherently organised within a voxel?



Unfortunately not, complex fibre patterns (e.g. crossings) are very common at the voxel scale.

Williams, Gluhbegovic, and Jew, "The Human Brain`; Dissections of the Real brain", Virtual Hopstital, Universitoy of Iowa, 1997

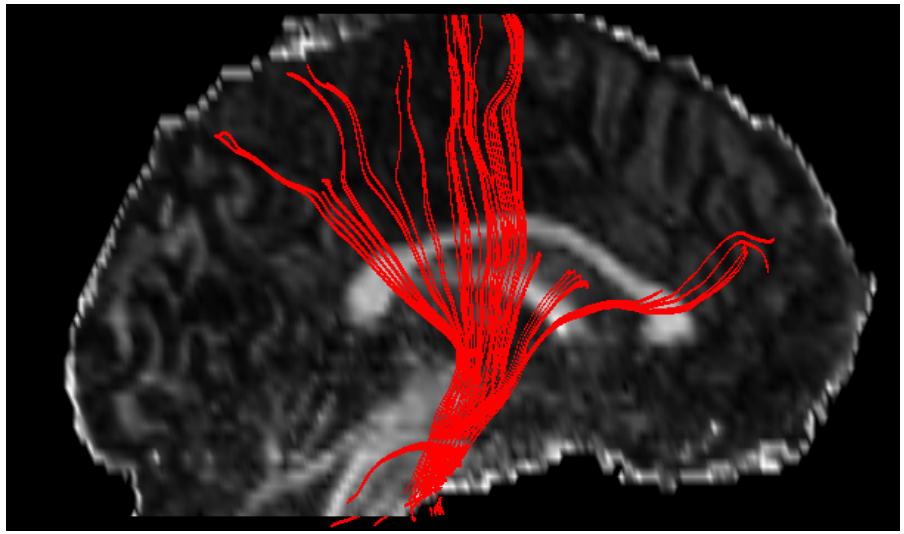
Streamlining reproducibility

Repeat an acquisition many times and repeat streamline tracking.

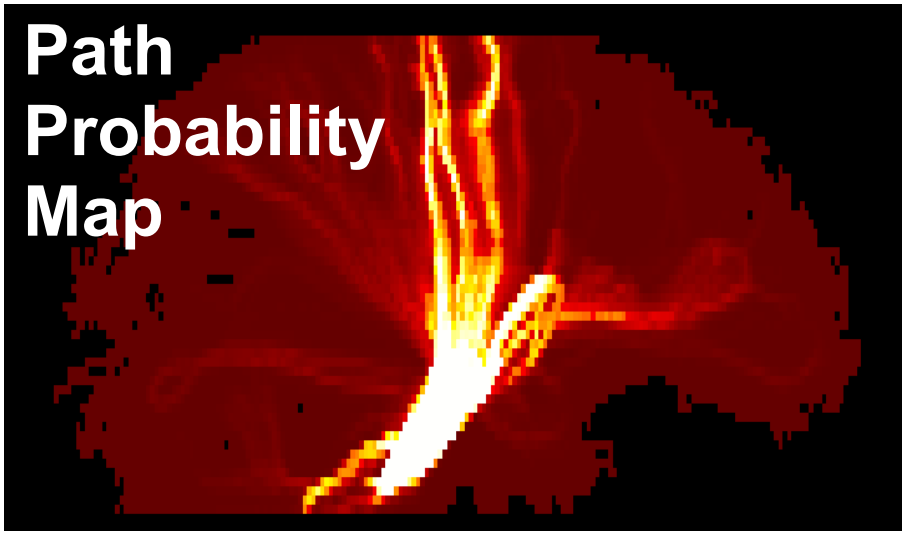
Due to uncertainty in $\mathbf{v}_1$, curves will not perfectly overlap

Create a map that shows the degree of overlap across the trials.

Streamlines from a single dataset



Map that shows where results across datasets overlap



Low Reproducibility — High Reproducibility

Probabilistic Tractography

- We normally have one dataset per subject, not many.

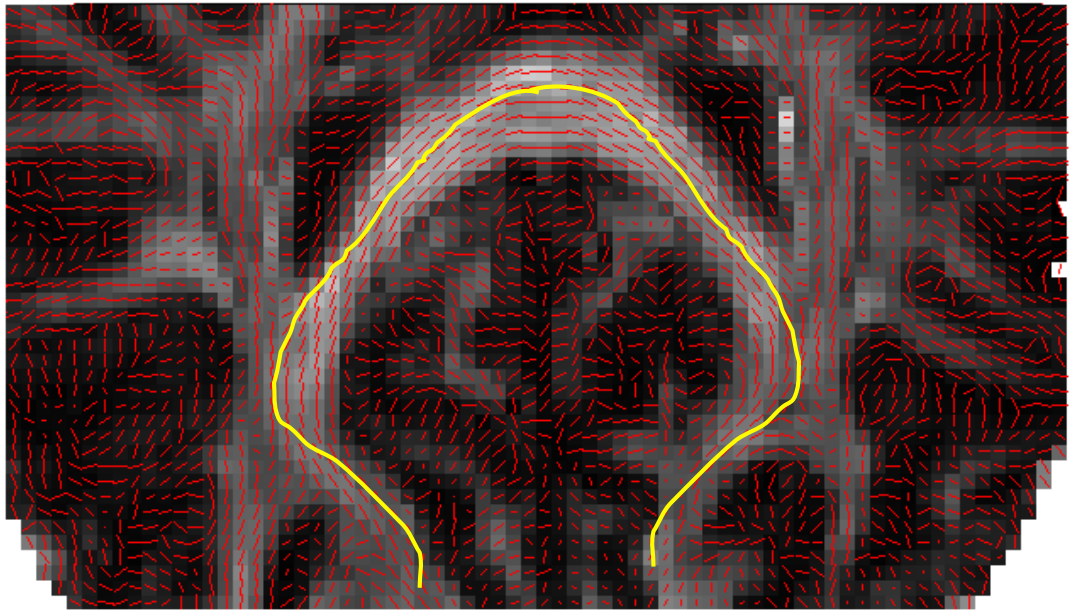
- Probabilistic Tractography as a two-step process:

a) Use DWI data and a model to infer a fibre orientation **and its uncertainty** in each voxel.

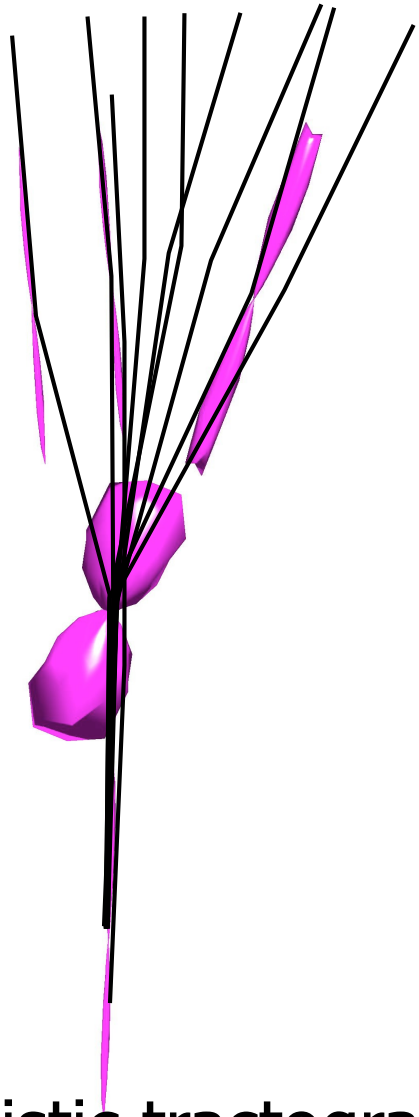
b) Use the estimates **and the uncertainty to build a path probability map** to a seed.

Probabilistic tractography

- But now, we no longer have a single direction at each voxel. How can we do tractography?



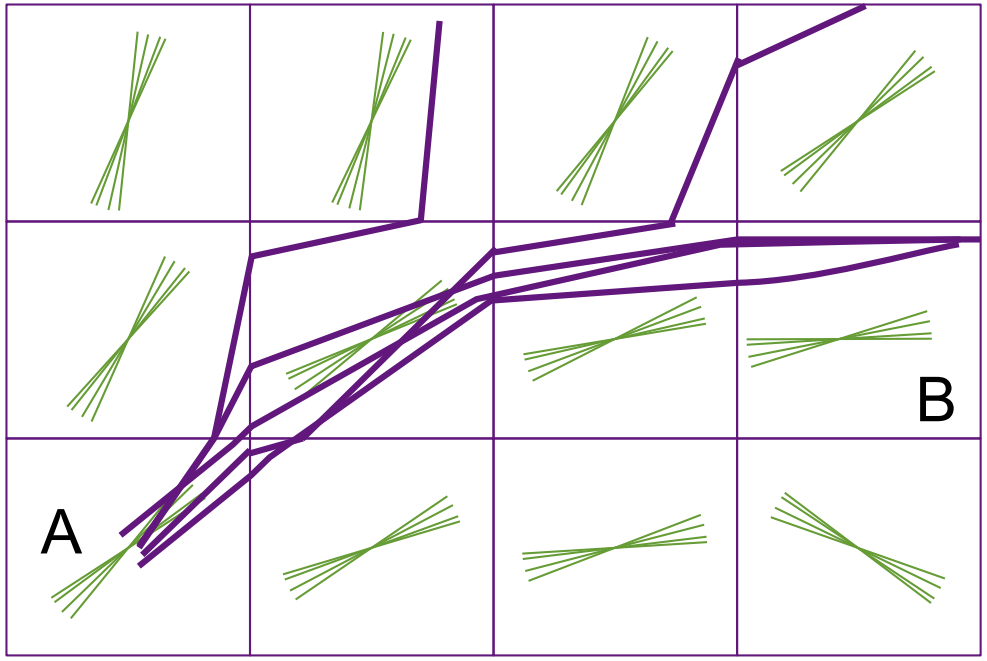
'Streamlining'



Probabilistic tractography

Behrens et al, 2003, Parker et al. 2003, Hagmann et al 2003, Jones et al. 2004

Probabilistic Tractography - Propagating the Uncertainty

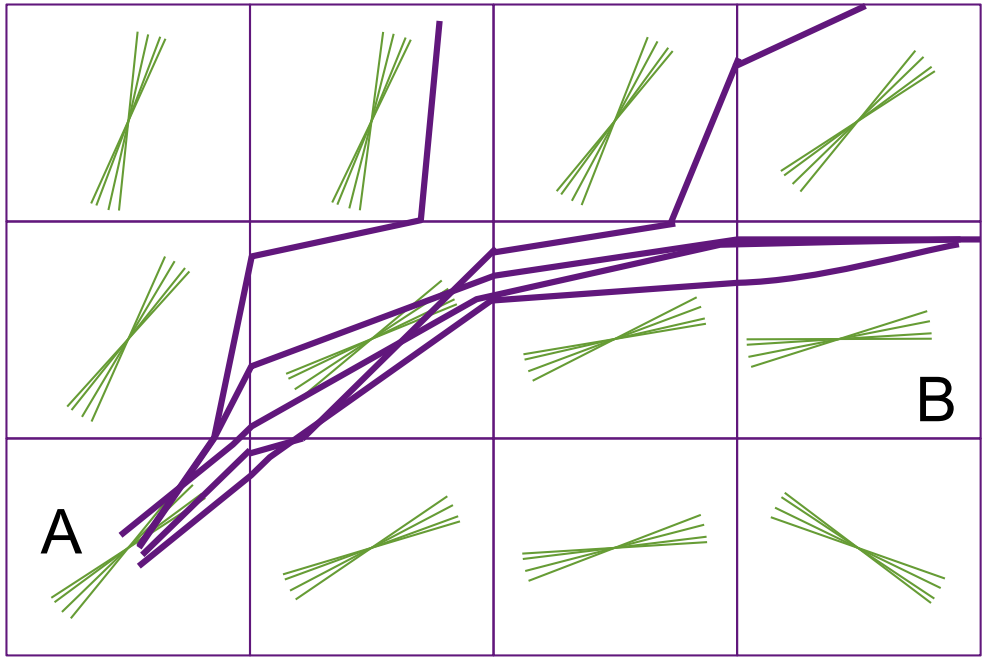


Behrens et al, 2003
Parker et al, 2003

- Propagate N streamlines from a seed, but for each propagation step choose randomly an orientation from the underlying distribution.

- Build a spatial distribution of curves that mimics the overlapped results from multiple deterministic tracking on multiple scans

Probabilistic Tractography - Propagating the Uncertainty



Behrens et al, 2003
Parker et al, 2003

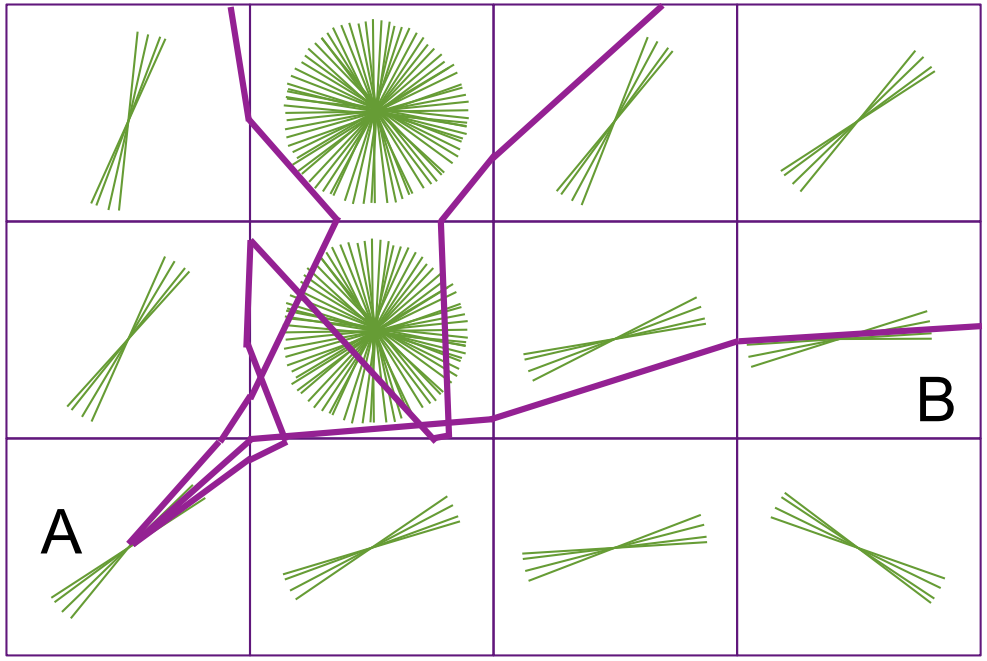
Define the degree of overlap at each location B, as:

$$P_{AB} = M/N$$

M:number of streamlines that go through B
N: total streamlines generated from A

This is the probability of a curve starting at A and going through B.

Probabilistic Tractography - Propagating the Uncertainty



Behrens et al, 2003
Parker et al, 2003

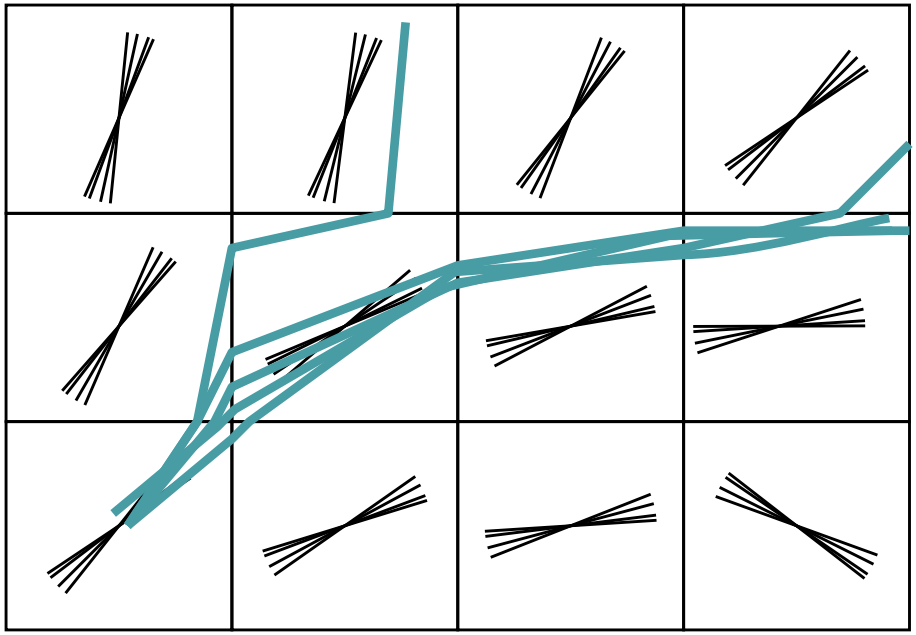
- Can now propagate through isotropic regions (e.g. GM).

- Do not need to stop when anisotropy is low, as in deterministic tracking.

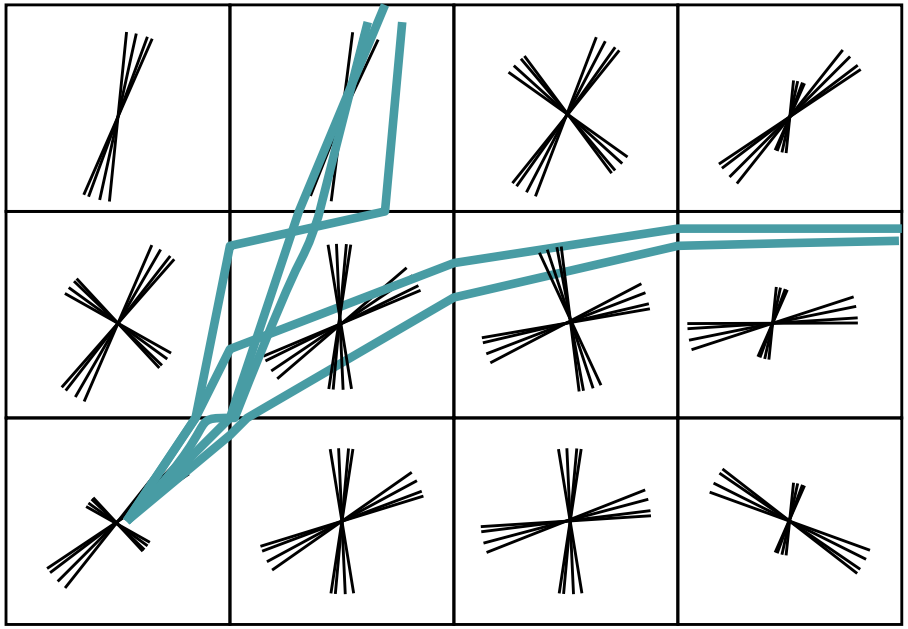
- The high uncertainty will be reflected in the probability map.

-Still impose a curvature threshold to avoid swirled trajectories.

Probabilistic Tractography in Multi-Fibre Fields



Behrens et al, 2003, Parker et al. 2003,
Hagmann et al 2003, Jones et al. 2004



Parker & Alexander 2003,
Behrens et al, 2007

When multiple fibre orientations exist in a voxel, choose the one that is most compatible with the incoming trajectory.

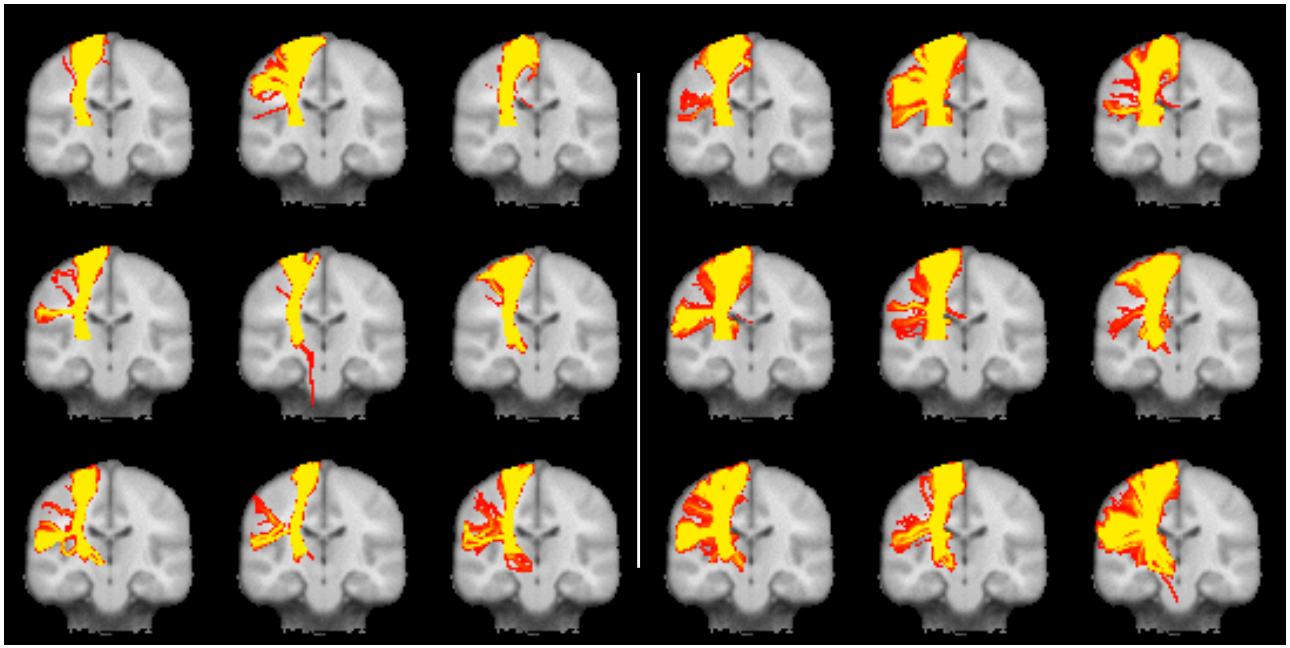
Probabilistic Tractography in Multi-Fibre Fields
Examples

Cortico-spinal tracts.
9 subjects

Behrens et al, 2007

SLF

Internal capsule ---- Primary motor cortex



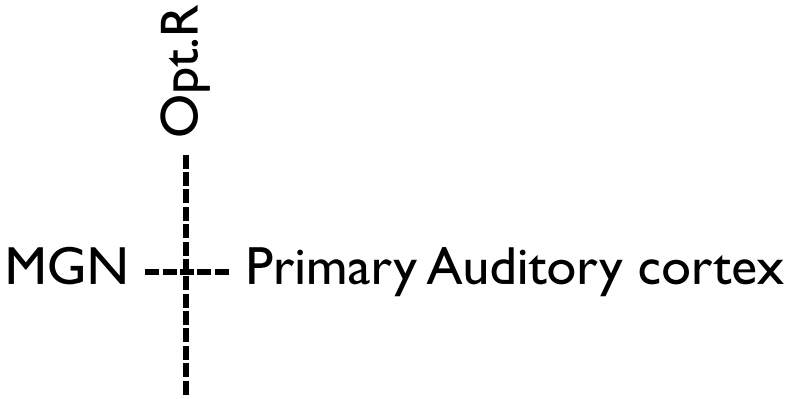
one fibre two fibres

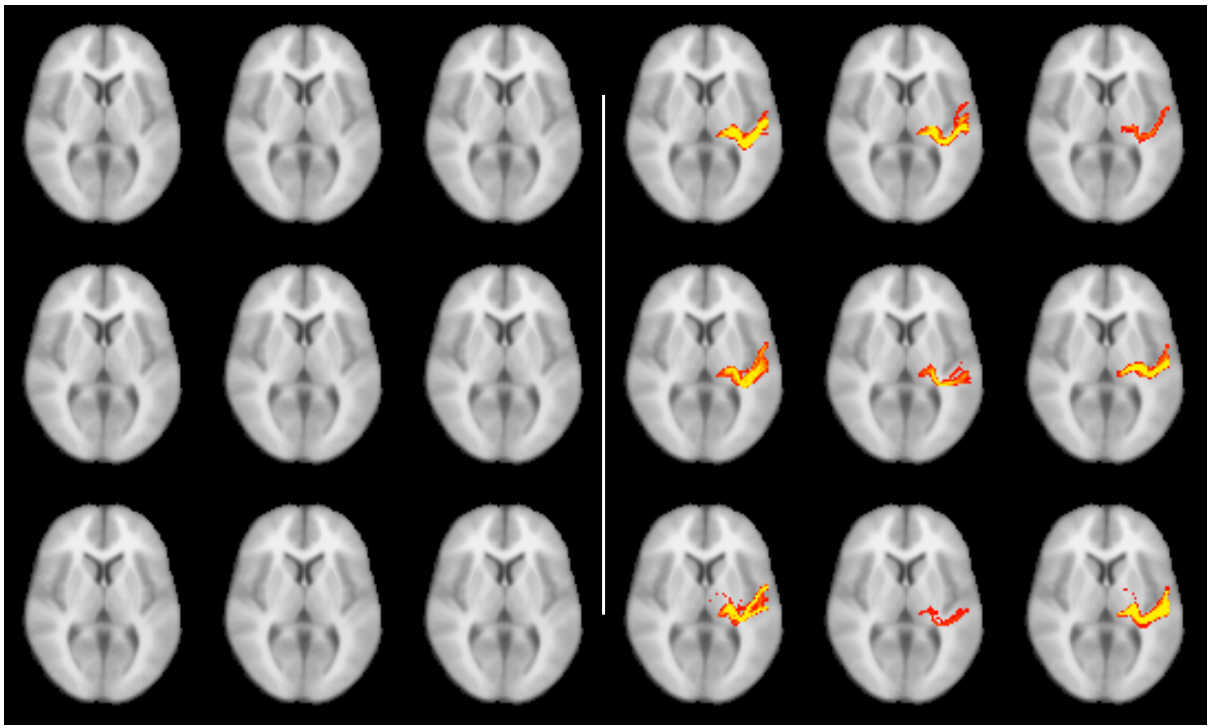
* If one fibre is modelled and we track through a crossing, a) we may not make it through the crossing, b) if we make it, the connectivity index will be relatively low.

Probabilistic Tractography in Multi-Fibre Fields
Examples

Acoustic radiations.
9 subjects

Behrens et al, 2007





one fibre

two fibres

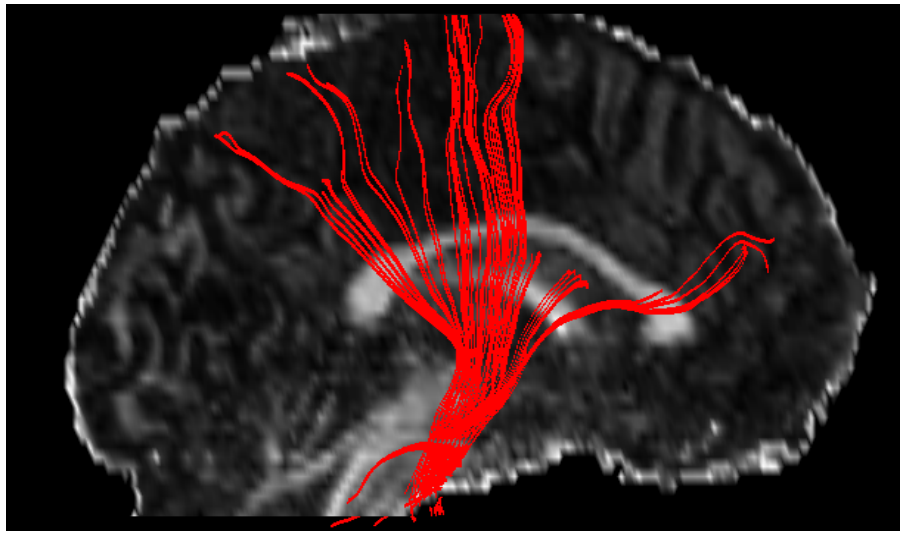
Path Probability Map

- Recall that it assesses how reproducible results are

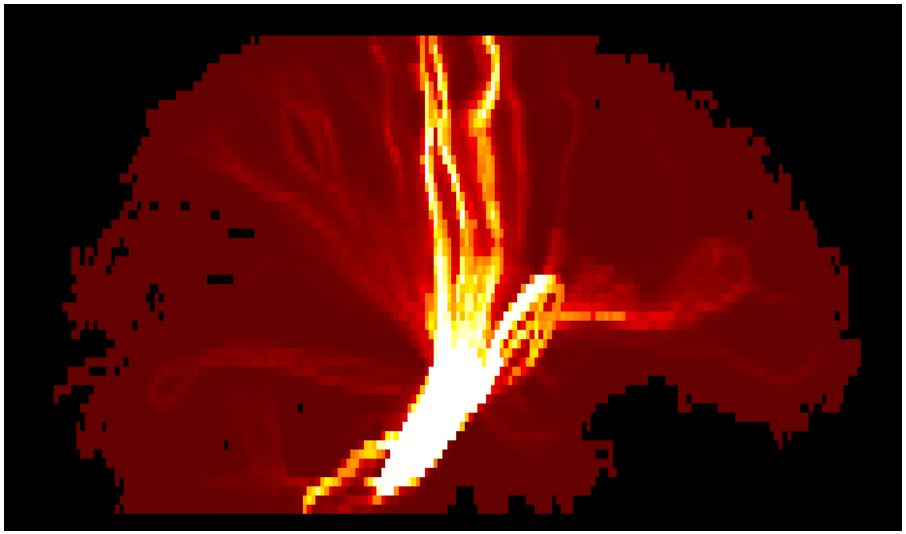
- Often called “connection probability”, “connectivity index”, “connectivity strength”. But it does not quantify how strong a connection is...

- Rather, how robust it is against noise/uncertainty

Deterministic Tractography



Probabilistic Tractography



Low Probability

High Probability

Probabilistic Streamline Tractography Summary

- Needs apart from orientation estimates, an estimate of their uncertainty. Does not need to be the ball and stick model, the DTI model can be used instead!

- Propagate streamlines repeatedly from a seed, but the orientation field is no longer deterministic. In each propagation step choose randomly an orientation from the underlying distribution.

- A connection probability value>=0 can be obtained from a seed A to any voxel in the brain B. This assesses **the reproducibility of the path from A to B, along which water molecules preferably diffuse.**

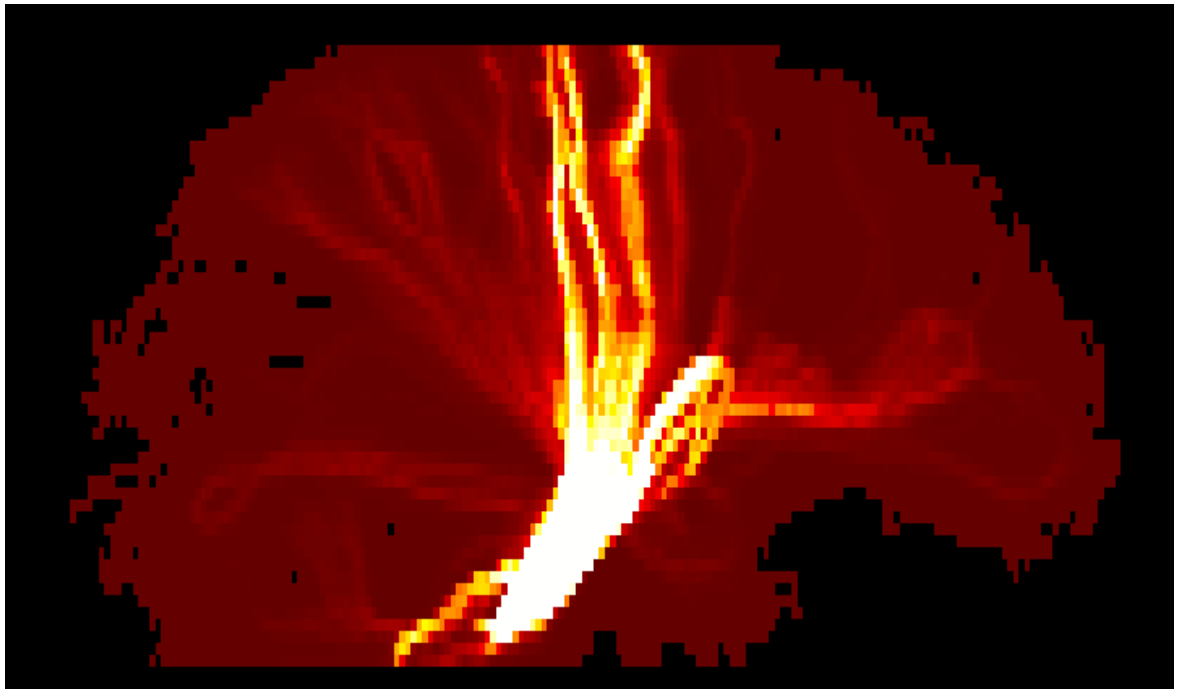
Adding Prior Knowledge to Tractography

- Because of the uncertainty propagation, the spatial distribution of paths is often very wide.

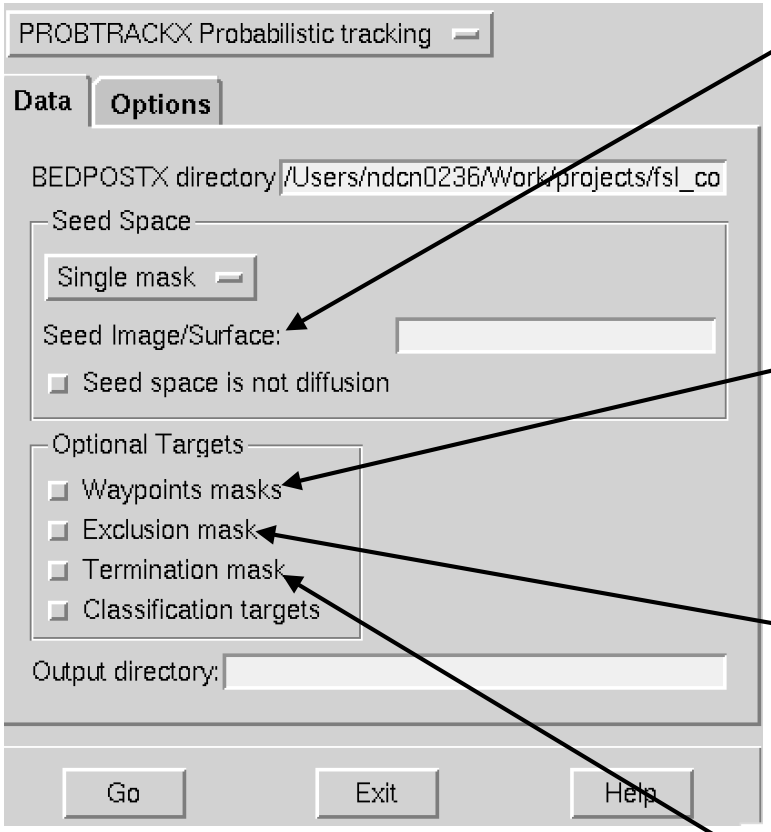


Low Probability

High Probability

Adding Prior Knowledge to Tractography

Fdt GUI:



- Once a seed is specified, prior anatomical knowledge can be imposed to assist the dissection of a specific tract.
- **Waypoint** ROIs
  If a curve does not go through, it is discarded.
- **Exclusion** ROI
  If a curve goes through, it is discarded.
- **Termination** ROI
  If a curve goes through, it is terminated.

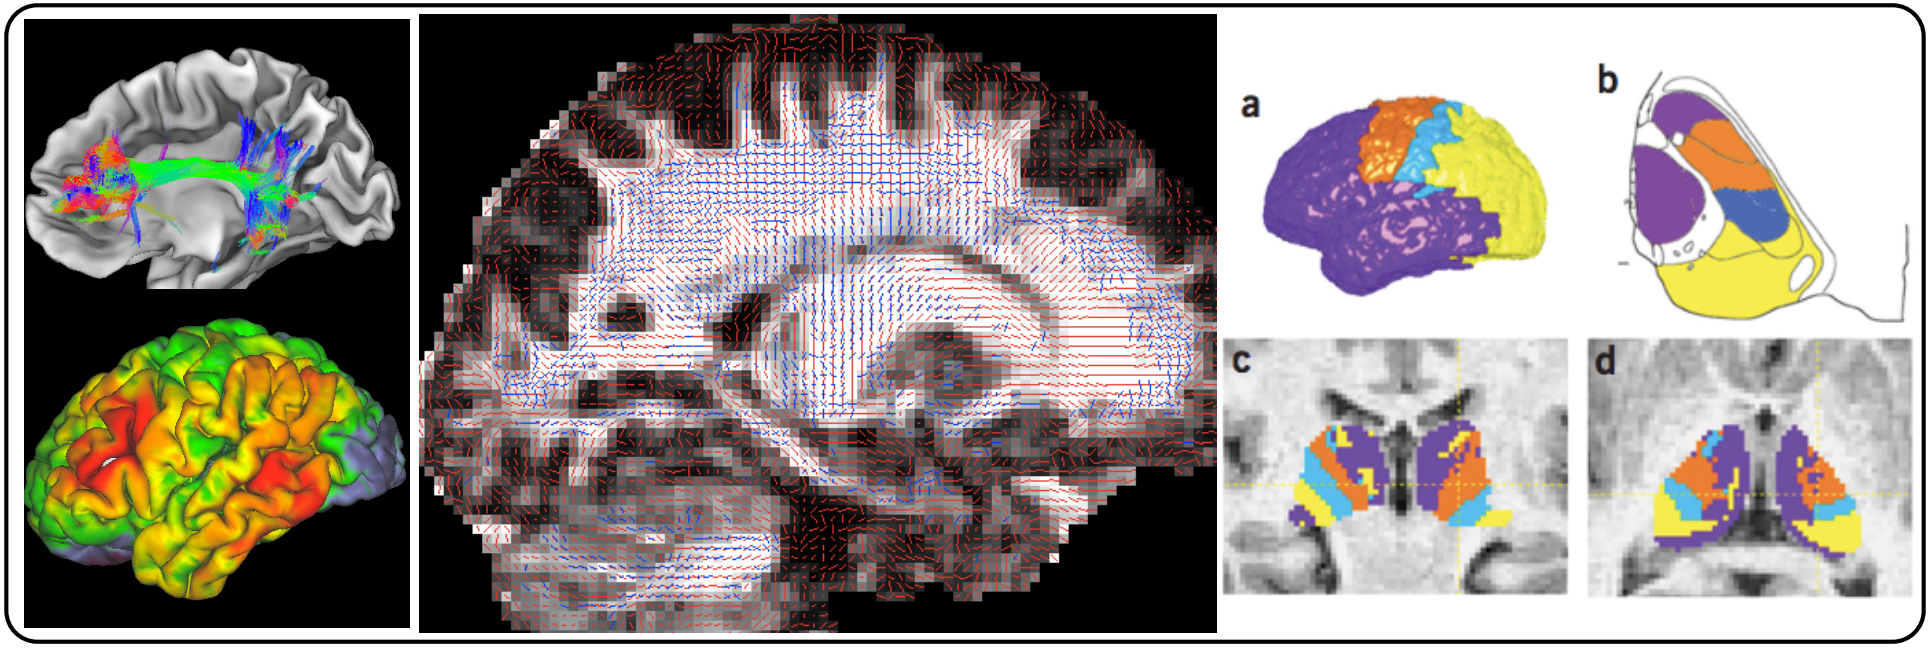
Overview

- Goal of tractography
- Estimating Fibre Orientations - BEDPOSTX
- Probabilistic Tractography - PROBTRACKX
- ProbtrackX outputs
- Tractography limitations



What is a quantitative measure of connectivity?

- Number of axons connecting 2 areas?
- Proportion of axons from a seed that reach a target?
- "Integrity" of the connecting white matter …
  - Effective conductivity?
  - Degree of myelination?
  - Packing density?
- What are we measuring?
  - The probability that the **dominant** path through the diffusion field passes through this region.

Connection Probabilities

- They may reflect "*Connection Strength*"

- But they do also reflect other uninteresting factors, such as:

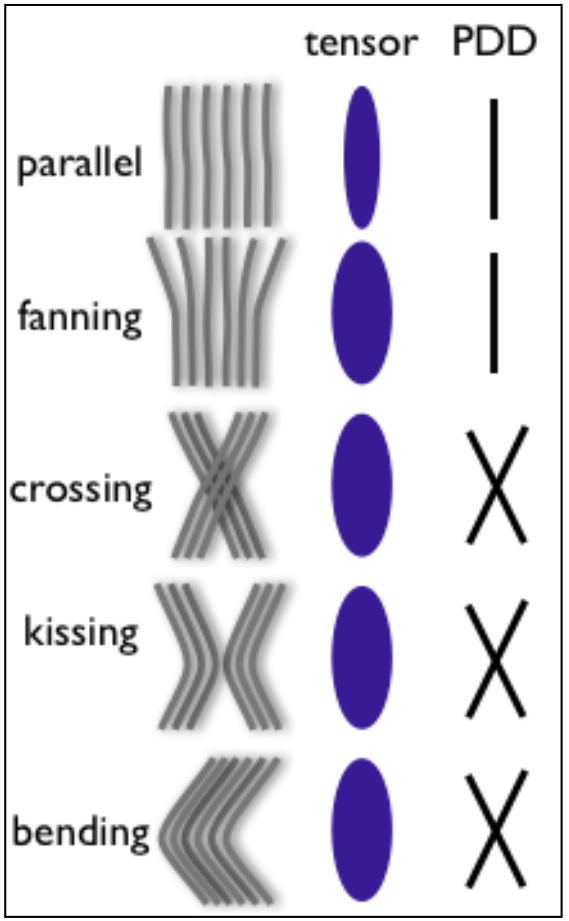
  Connection length: Longer connections have smaller probability than shorter ones

  Geometric complexity: Probabilities of connections that go through regions of complex structure will be smaller than connections than go through more coherent regions

- Cross-subject comparison of the same tract is more meaningful than comparing different tracts

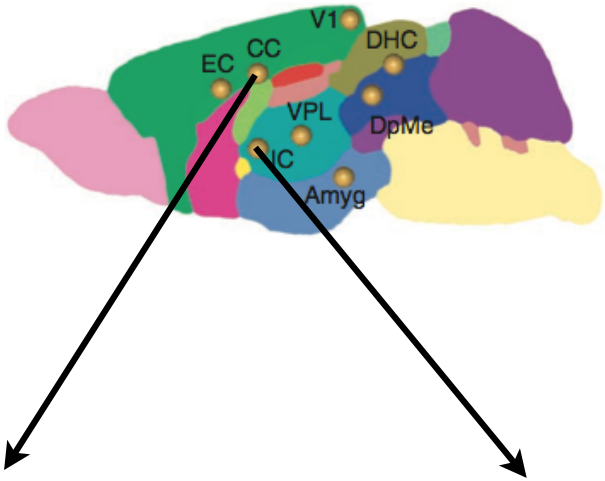
Can we trust tractography?

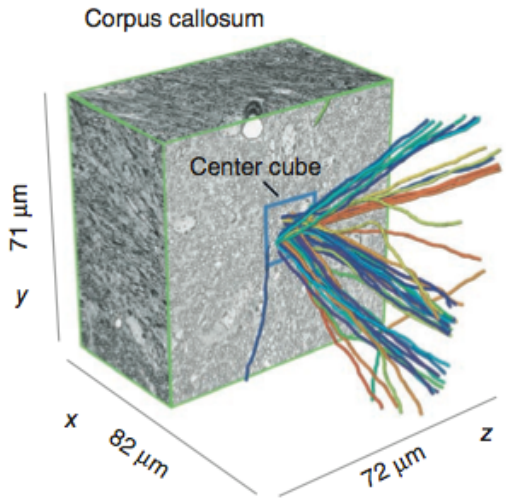
Is the direction of least hindrance to diffusion a good proxy for fibre orientation?

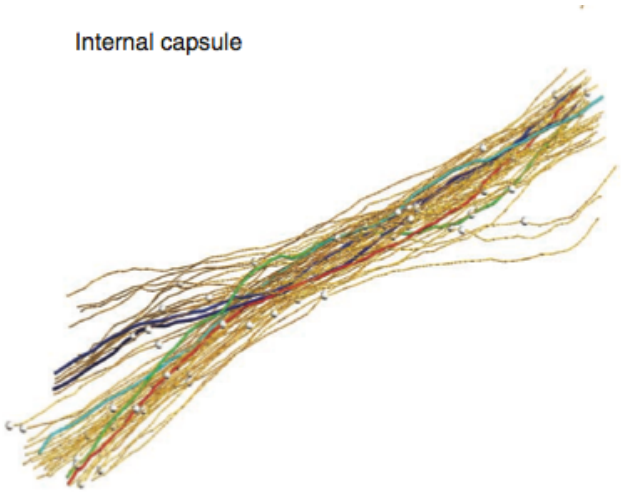


mapping between axon geometry and diffusion profile can be ambiguous

White matter organisation can be surprising







Whole mouse brain Electron Microscopy!
